TABLES

Table

POPULATION

1. Population, area and density for each part of the world: latest census and midyear estimates of population for 1937, 1952, 1953 and 1954 97

1A. Population, area and density of continental divisions, by regions: 1920–1953 111

2. Estimates of total population: 1920–1954 112

3. Population by age and sex: latest census, 1946–1953, and latest available estimate, 1950–1954 ... 122

4. Married population by age and sex, number and percent in each age group: latest censuses 136

5. Women by age and number of children ever born 196

6. Women by age and number of children living ... 224

7. Children under 5 years per 1 000 women aged 15–49 years: censuses 1900–1952 236

TABLEAUX

Tableau

POPULATION

1. Population, superficie et densité de chaque partie du monde: dernier recensement et estimations de la population au milieu de l'année pour 1937, 1952, 1953 et 1954 97

1A. Population, superficie et densité des continents suivant les régions: 1920–1953 111

2. Estimations de la population totale: 1920–1954 .. 112

3. Population selon l'âge et le sexe: dernier recensement, 1946–1953, et estimation disponible, 1950–1954 122

4. Population mariée selon l'âge et le sexe, effectif et répartition pour cent dans chaque groupe d'âge: derniers recensements 136

5. Population féminine selon l'âge et le nombre d'enfants nés vivants 196

6. Population féminine selon l'âge et le nombre d'enfants vivants 224

7. Nombre d'enfants de moins de 5 ans pour 1 000 femmes de 15 à 49 ans: recensements 1900–1952. 236

49866

TABLES (continued)

Table *Page*

BIRTHS

8. Number of live births: 1938–1953 242
9. Crude birth rates: 1920–1953 252
10. Number of live births by age of mother: 1936–1953 262
11. Birth rates specific for age of mother: 1936–1953. 283
12. Number of legitimate live births by age of mother: 1936–1953 295
13. Legitimate birth rates specific for age of mother: 1936–1953 304
14. Number of live births by age of father: 1936–1953 307
15. Birth rates specific for age of father: 1936–1953.. 318
16. Number of live births by live-birth order: 1936–1953 325
17. Birth rates by live-birth order: 1936–1953 340
18. Number of live births by age of mother and live-birth order: latest available years 350
19. Birth rates by live-birth order specific for age of mother: 1948 and 1951 418
20. Legitimate live births by duration of marriage, number and percentage distribution: 1936–1953. 432

REPRODUCTION RATES

21. Gross and net reproduction rates: 1920–1953.... 456

STILLBIRTHS

22. Number of stillbirths (late fœtal deaths): 1938–1953 462
23. Stillbirth (late fœtal death) ratios: 1938–1953... 470
24. Number of stillbirths (late fœtal deaths) by age of mother: 1936–1953 480
25. Stillbirth (late fœtal death) ratios specific for age of mother: 1936–1953 491
26. Number of stillbirths (late fœtal deaths) by age of mother and total-birth order: latest available years 500
27. Stillbirth (late fœtal death) ratios specific for age of mother and total-birth order: latest available year 509

TABLEAUX (suite)

Tableau *Page*

NAISSANCES

8. Nombre de naissances vivantes: 1938–1953..... 242
9. Taux bruts de natalité: 1920–1953 252
10. Naissances vivantes selon l'âge de la mère: 1936–1953 262
11. Taux de natalité selon l'âge de la mère: 1936–1953 283
12. Naissances vivantes légitimes selon l'âge de la mère: 1936–1953 295
13. Taux de natalité légitime selon l'âge de la mère: 1936–1953 304
14. Naissances vivantes selon l'âge du père: 1936–1953 307
15. Taux de natalité selon l'âge du père: 1936–1953. 318
16. Naissances vivantes selon le rang: 1936–1953.... 325
17. Taux de natalité selon le rang de naissance: 1936–1953 340
18. Naissances vivantes selon l'âge de la mère et le rang de naissance: dernières années disponibles.. 350
19. Taux de natalité selon le rang de naissance et l'âge de la mère: 1948 et 1951 418
20. Naissances vivantes légitimes selon la durée du mariage, nombres absolus et répartition pour cent: 1936–1953 432

TAUX DE REPRODUCTION

21. Taux bruts et nets de reproduction: 1920–1953.. 456

MORT-NES

22. Nombre de mort-nés (morts fœtales tardives): 1938–1953 462
23. Taux de mortinatalité: 1938–1953 470
24. Mort-nés (morts fœtales tardives) selon l'âge de la mère: 1936–1953 480
25. Taux de mortinatalité selon l'âge de la mère: 1936–1953 491
26. Mort-nés (morts fœtales tardives) selon l'âge de la mère et le rang de naissance: dernières années disponibles 500
27. Taux de mortinatalité selon l'âge de la mère et le rang de naissance: dernière année disponible.... 509

TABLES (continued)

Table *Page*

DEATHS

28. Deaths, 1946–1953, and crude rates, 1920–1939 and 1946–1953 516
29. Death rates specific for age and sex: 1946–1953 .. 526
30. Deaths and death rates by cause: latest years 1945–1953 558
31. Infant deaths, 1946–1953, and infant mortality rates, 1920–1939 and 1946–1953 588

MARRIAGES

32. Marriages, 1946–1953, and crude marriage rates, 1920–1939 and 1946–1953 598
33. Marriage rates specific for age and sex: 1936–1952 608

DIVORCES

34. Divorces and crude divorce rates: 1946–1953 614
35. Divorce rates per 1 000 married couples: 1935–1953 620

LIFE TABLES

36. Life table mortality rates at specified ages for each sex: unpublished data 622
37. Survivors at specified ages for each sex: unpublished data 626
38. Expectation of life at specified ages for each sex: unpublished data 630

INTERNATIONAL POPULATION MOVEMENTS

39. Major categories of departures and arrivals: 1948–1953 634
40. Emigrants by country of intended permanent residence: 1950–1953 644
41. Immigrants by country of last permanent residence: 1950–1953 655
42. Emigrants by age and sex: 1950–1953 666
43. Immigrants by age and sex: 1950–1953 673

DECES

28. Décès, 1946–1953, et taux bruts de mortalité, 1920–1939 et 1946–1953 516
29. Taux de mortalité selon l'âge et le sexe: 1946–1953 526
30. Décès selon la cause: nombres et taux pour les dernières années disponibles 1945–1953 558
31. Décès d'enfants de moins d'un an, 1946–1953, et taux de mortalité infantile, 1920–1939 et 1946–1953 588

MARIAGES

32. Mariages, 1946–1953, et taux bruts de nuptialité, 1920–1939 et 1946–1953 598
33. Taux de nuptialité selon l'âge et le sexe: 1936–1952 608

DIVORCES

34. Divorces, nombres et taux bruts: 1946–1953 614
35. Taux de divorce pour 1 000 couples mariés: 1935–1953 620

TABLES DE MORTALITE

36. Quotients de mortalité à un âge donné pour chaque sexe: données inédites 622
37. Survivants à un âge donné pour chaque sexe: données inédites 626
38. Expérance de vie à un âge donné pour chaque sexe: données inédites 630

MOUVEMENTS INTERNATIONAUX DE POPULATIONS

39. Catégories principales de sorties et d'entrées: 1948–1953 634
40. Emigrants par pays de résidence permanente prévue: 1950–1953 644
41. Immigrants par pays de la précédente résidence permanente: 1950–1953 655
42. Emigrants selon l'âge et le sexe: 1950–1953 666
43. Immigrants selon l'âge et le sexe: 1950–1953 673

BIBLIOGRAPHIE 681

INDEX DES PAYS COMPRIS DANS CHAQUE TABLEAU 709

LISTE DES TABLEAUX PARUS DANS L'ANNUAIRE 723

Foreword

The *Demographic Yearbook* is prepared by the Statistical Office of the United Nations. It presents population, natality, mortality, nuptiality, divorce, and migration statistics, life-table values, an explanatory chapter of "Technical Notes on the Statistical Tables," and a Bibliography, together with country and subject indexes. The statistical series are those received by means of questionnaires from the statistical administrations or appropriate government offices of all the geographic units or "countries" of the world, supplemented where necessary and feasible by data from national official publications. With the exception of the statistics of international migration, which are furnished by the International Labour Office, all the series are collected by the Statistical Office.

The sixth issue of the *Yearbook* contains a total of 44 separate tables, representing the most extensive tabular coverage yet published. In accordance with a rotation plan necessitated by the excessive amount of new material available each year, this issue presents special tables on *natality*. A total of 20 tables dealing with statistics of live birth or stillbirth alone are included, as well as four population tables of interest in connexion with fertility. The series previously published in the *Yearbook* have been extended and revised (see Cumulative list of tables, p. 723) and, in addition, eight new tables are presented for the first time; these are as follows:

Married population by age and sex (Table 4)
Legitimate live births by age of mother (Table 12)
Legitimate live-birth rates specific for age of mother (Table 13)
Live-birth rates by age of mother and live-birth order (Table 19)
Stillbirths by age of mother (Table 24)
Stillbirth ratios specific for age of mother (Table 25)
Stillbirths by age of mother and total-birth order (Table 26)
Stillbirth ratios specific for age of mother and total-birth order (Table 27)

The "Technical Notes on the Statistical Tables" have been expanded to include a somewhat more detailed discussion of the quality of the data, both in a general sense and specifically for each table. Reference is made to the United Nations *Principles for a Vital Statistics System*,[1] which comprise the recommendations for the improvement and standardization of vital statistics, approved by the Economic and Social Council at its seventh session (April 1953). Wherever possible, the limitations of international vital statistics presented in the *Yearbook* are discussed in terms of these Principles.

The Bibliography in this issue supplements the comprehensive one published in the 1953 *Yearbook*, presenting only new titles seen since that time. Like those published previously, the Bibliography was prepared by the Census Library Project of the United States Bureau of the Census and the Library of Congress.

As a source of basic data for demographers, economists, and public-health workers, the *Demographic Yearbook* should not be considered as an isolated volume adequate for all purposes. It should rather be considered as one of a co-ordinated and interrelated set of periodic publications issued by the United Nations and the specialized agencies.

In particular, the general interest of the United Nations in the broad range of demographic data and that of the World Health Organization in statistics needed for the study of health problems form the basis of the close co-operation of these agencies in the collection and publication of population, vital, and other related types of statistical data. Under the co-ordinated plans, the United Nations *Demographic Yearbook* is the central international source of demographic data for the demographer or the economist. Some of the data assembled for the *Demographic Yearbook* are reprinted in the publications of the World Health Organization so as to be in a form readily accessible to the medical and public-health professions. In addition, publications of the World Health Organization, in particular its series *Annual Epidemiological and Vital Statistics,* contain compilations of deaths by cause of death, age, and sex; special compilations of data for selected causes of death; detailed data on cases and deaths for notifiable diseases; and other data of medical interest.

Considered together, the publications of the United Nations and the World Health Organization cover the major important types of statistics on population, vital events, and health, and both sets of publications should be used when detailed figures on the full range of internationally assembled statistics on these subjects are required.

The Statistical Office owes special acknowledgement to the Population Branch of the Bureau of Social Affairs of the United Nations for the preparation of estimates of the population of continental divisions and regions (Table 1. A), for the classification of estimates by type (Table 1) and for the development and application of the age-accuracy test mentioned in the Technical Notes.

TECHNICAL NOTES ON THE STATISTICAL TABLES

SCOPE OF DATA

As a general rule, the statistics presented in this *Yearbook* relate to the present territory of the geographic unit specified. Whenever the territory to which data relate is other than that of 1954, footnotes have been used to describe the way in which the area differs from that within the present geographic boundaries. Thus, in the absence of a footnote, it may be assumed that the statistics relate to the territory within present boundaries, even though they refer to a period of time when the geographic constitution of the area in question was different from the present one.

A few exceptions to this rule have been allowed to occur in that very minor changes in boundaries have not been footnoted consistently in all tables. Examples of unnoted changes of the type described are the transfer of small border areas between Italy and France in 1947 which affected a very small but unknown number of persons, and the transfer of Finnish territory to the USSR in 1940 and later years, which did not affect the continuity of demographic data because the population was moved out of the ceded territory. In all cases, such changes, as well as others, have been footnoted in Table 1 but not in Tables 2-43 where their influence is thought to be negligible. It is recommended, therefore, that, to establish the exact geographic boundaries involved, reference should be made to Table 1.

In assembling national statistics for publication in the *Yearbook,* the aim has been to present data for the present-in-area or *de facto* population, rather than for the habitually resident or *de jure* population. Thus, unless otherwise noted, the series include jungle tribes, aborigines, nomadic peoples, displaced persons, internees, and refugees. One outstanding exception to this policy has been made in the case of population figures for war years where, when the required statistics were available, the present-in-area population estimate has been adjusted to include armed forces stationed outside the country in question and to exclude alien armed forces and enemy prisoners of war located in the country. Such adjustments are noted in the tables both where the population figures are shown and, if applicable, where they are used in the computation of vital statistics rates.

The modified *de facto* population described above and the true *de jure* figure do not differ greatly from one another. The *de jure* count ordinarily includes armed forces abroad and excludes alien armed forces in the country; consequently, figures noted in the tables as *"de jure"* may be assumed to do so unless otherwise indicated. The chief difference between a modified *de facto* figure and a *de jure* figure is that the former includes all civilians in the country at a stated time without reference to legal or habitual residence, while the latter includes civilian residents abroad and excludes civilian non-residents in the country. Because of variations in the definition of "resident", the comparability of national *de jure* totals is somewhat less than that of national *de facto* totals. However, it should be added that, under ordinary circumstances, the difference between the two is relatively small.[1]

GEOGRAPHIC COVERAGE

In accordance with the original plan for the contents of the *Demographic Yearbook,*[2] the aim has been to make the geographic coverage of each table as extensive as possible. To this end, data have been included for "registration areas," "tabulation areas," and the like, as well as statistics for cities if broader coverage is not available. Limiting factors are introduced, however, into tables devoted solely or primarily to rates computed by relating vital statistics to population, in that the two components must be available for the same year and geographic area before the area may be included in the table. Lack of the required official population component has seriously restricted the coverage in tables of rates specific for age, such as Tables 11, 15, 17, 19 and 29, and in those specific for marital status, namely Tables 13, 33 and 35. It has also reduced the potential coverage of the crude rate tables to some extent (see also "Official Nature of Data" below).

Another factor, which has tended to limit the geographic coverage, is the omission of areas for which frequencies are extremely small. Although no consistent criteria have been used, crude rates or ratios based on frequencies of less than 15 are usually not computed; indices specific for a characteristic such as age or birth order are usually not computed on a distribution which totals less than 50. This policy is relaxed somewhat in the case of the tables dealing with natality, inasmuch as this issue lays special emphasis on that subject.

NOMENCLATURE

The names applied to the various geographic units for which data are presented are those currently accepted. For reasons of space and convenience, country names are generally given in their shortened form, provided it is widely recognized and in common use. Thus, the Republic

[1] For a more detailed discussion of *de jure* and *de facto* concepts, see *Population Census Methods,* United Nations, Department of Social Affairs, Population Division, and Department of Economic Affairs, Statistical Office, document ST/SOA/Series A, Population Studies No. 4, Lake Success, New York, November 1949, pp. 6-13.

[2] United Nations. *Report of the Population Commission* (second session). United Nations document E/571, annex A, p. 11.

of the Philippines is listed as the "Philippines", the United States of Brazil as "Brazil", the United States of America as "United States", the Hashemite Kingdom of the Jordan as "Jordan", and the United Kingdom of Great Britain and Northern Ireland as the "United Kingdom". For the same reason, the Federal Republic of Germany and the Democratic Republic of Germany are now listed in all the tables as Western and Eastern Germany, respectively. Table 1 carries a footnote giving the full name and composition of each.

Name changes which have taken place during the first half of 1954 are in general included. For example, "Indochina" has been replaced by three separate entries, namely Cambodia, Laos, and Vietnam. Ethiopia and Eritrea are shown in Federation. Brunei, North Borneo, and Sarawak appear separately instead of under British Borneo. One notable exception, however, is the case of the Federation of the Rhodesias and Nyasaland, which became effective 23 October 1953. Consideration of space and presentation has determined that these three geographic areas continue to appear separately as Northern Rhodesia, Southern Rhodesia, and Nyasaland.

ARRANGEMENT

Except in Tables 1 and 39, the arrangement of the countries in the stubs or boxheads of the tables has been radically altered in this issue of the *Yearbook*. Table 1 continues to show for each continent separately, all of the geographic units of the world arranged in English alphabetic order within political-status groups. Table 39 is arranged in straight English alphabetical order. The change in arrangement affects the rest of the tables which now show the geographic units for which data are available arranged in English alphabetic order within continents. The sub-classification by "sovereign" and "other" has been eliminated, although the non-self-governing areas are still identified by the initials of the administering authority in brackets following the name.

EVALUATION OF QUALITY OF DATA

As in previous *Yearbooks,* the latest official estimates of population, in this case those for 1952-54, have been classified by type, and vital statistics have been evaluated for "completeness", both of which classifications will be described in detail in the appropriate section below. Attention is called to the fact that, for reasons of space and convenience, the code applied to distinguish one type of population estimate from another appears only in connexion with Table 1, and that which qualifies the vital statistics appears only in the trend tables of live birth, death, infant mortality, marriage, and divorce (Tables 8, 9, 28, 31, 32, and 34). Despite the fact that the qualifying codes are appended in each case to one table only, it should be noted that they are equally applicable to corresponding data for the same years in all other tables. Therefore, in using data from any table, reference should be made to the "evaluation" shown for the area on the corresponding trend table. To facilitate this cross reference, the identity of the related table is given in the headnote.

Another qualifying index reintroduced in the 1953 *Yearbook* has been continued. This is a dagger (†) used to distinguish those statistics which have been tabulated according to the year of registration rather than by the year of occurrence. The importance of this qualification, especially in evaluating tabulated live births, cannot be overemphasized. A detailed exposition of the implications of this factor will be found on p. 20 below.

OFFICIAL NATURE OF DATA

All basic data presented in the *Yearbook* are official statistics provided by Governments. In order to establish comparability in so far as computation procedures are concerned, all rates and ratios (except life-table functions, reproduction rates, and one or two minor exceptions noted in the tables) have been computed in the Statistical Office of the United Nations according to the method described in the appropriate sections below.

In general, the population series used to compute rates are official censuses or estimates published in the *Yearbook;* crude rates are based on populations shown in Table 2; rates specific for age and sex on those in Table 3. In connexion with crude rate trends it should be noted that, in some instances, the population estimates used for the computation of rates for the most recent intercensal period have not yet been revised to accord with the results of censuses taken between 1950 and 1953. The rates are, therefore, subject to change when revised estimates become available. Since the numerator of these rates in most cases will not be revised, the rates themselves are not marked provisional; to identify those affected, reference should be made to Table 2, "Estimates of Total Population," where unrevised estimates are identified with a section mark (§).

DISCREPANCIES AMONG TABLES

In preparing the tables for publication, occasional disparities were found in the statistics dealing with different characteristics but relating to the same area at a given date. Most of these were corrected and reconciled by consulting published sources or through correspondence with the governments concerned. But there still remain a few unresolved differences. These are noted in the tables and the differences explained wherever possible.

AREA AND POPULATION

EVALUATION OF QUALITY OF DATA

Population data will be found in Tables 1 to 7 of this *Yearbook,* while area figures are presented in Table 1 only. The population data presented are both census figures and estimates. An analysis of the method of population estimation, e.g., based on census returns or derived from other data, has provided a fairly precise evaluation code which is set forth only in Table 1 but which can be applied to corresponding estimates appearing in Tables 2 and 3.

The classification of post-war estimates of population by type of estimate which was introduced in the 1949-50 issue of the *Yearbook* was completely reviewed and revised where necessary for the 1952 issue and has been systematically modified in accordance with new information for presentation in this issue. The code used is similar

to that used previous to 1952, but it has been revised to give weight to the fact that many countries had censuses in 1950 and succeeding years and also to eliminate from the code some of the less relevant factors heretofore taken into account. Thus, in the case of censuses, recency is the prime consideration if adjustments to current dates are based on vital statistics and migration data; both recency and frequency are taken into account if the method of adjustment is mathematical extrapolation.

Type-of-estimate code

As before, the code consists of two parts. The first part, represented by a letter, indicates the nature of the base data, according to the following scheme:

R. Continuous population registers.
A. Census enumerations, the last having been made since 1 January 1950.
B. Census enumerations, the last having been made between 1 January 1945 and 1 January 1950.
C. Census enumerations, the last having been made prior to 1 January 1945.
D. Non-censal counts or partial censuses.
E. Conjectural estimates derived by other means than counting.

The second part of the code, represented by a numeral 1 to 8, indicates the method utilized for adjusting the base data for other dates and, where the method is the "balancing equation" (i.e., adjustment by means of statistics of births, deaths, and migration), the general quality of the data used in the adjustment. Where the base data on population size are supplied each year, as is generally the case with a continuous population register, no adjustment is required, and the second part of the code is shown as "0". Methods of time adjustment are classified as follows:

0 None, base data being secured annually and requiring no time adjustment.
1 Substantially accurate statistics of births and deaths, and (where relevant) comprehensive migration statistics.
2 Substantially accurate statistics of births and deaths; doubtful or deficient data on migratory movements, or no account taken of such movements.
3 Birth and death statistics of undetermined reliability (adequacy of migration data is disregarded).
4 Birth and death statistics which are stated to be deficient (adequacy of migration data is disregarded).
5 Mathematical extrapolation (or interpolation), at least three censuses having been taken since 1900.
6 Mathematical extrapolation (or interpolation), less than three censuses having been taken since 1900.
7 Assumed rates of increase not derived by mathematical extrapolation.
8 None, base figure being held constant.
. . Method of adjustment not ascertained.

Alphabetic part: The arrangement of letters and numerals in the classification scheme follows, in general, a descending scale of reliability. The code "R0" indicates that the estimates were obtained directly from a continuous population register and that they may be regarded as of the first order of reliability. For present purposes, a continuous population register is defined as a registration system which maintains an individual file for each person in the population, a record being added for each birth, a record being removed for each death, and provision being made for the transfer of records with changes of residence. In so far as a figure for the total population can be obtained directly from such records each year, the accuracy of estimates so obtained is relatively independent of the periodicity or recency of population censuses or of the compilation of birth and death statistics from another source. Generally speaking, continuous registers lead to estimates which are superior to those derived from censuses, whereas other non-censal counting methods lead to less reliable estimates.

Estimates based on census enumerations are coded "A", "B", or "C", according to the date of the last census, as indicated above. No qualitative distinction among censuses has been attempted, but it should be understood that not all censuses are of comparable accuracy.

Estimates based on non-censal counts or partial censuses are coded "D". This category covers a fairly wide range of types, including ration registrations, tax lists, hut counts, partial enumerations and group enumerations such as are made in a number of African areas where the household, tribe, or village serves as the unit for counting. The accuracy of these counts varies considerably, but as a group they may be regarded as yielding results inferior to those generally obtained by the census method of individual enumeration. In the case of annual counts (coded "D0"), the yearly repetition of the operation is likely to lead to improved accuracy.

Estimates based on conjectures or guesses as to population size made at some time in the past are coded "E". Such estimates should be regarded merely as rough indications of probable population size.

Numerical part: The numerical part of the code distinguishes three types of time adjustment. The first type, adjustment on the basis of statistics of births, deaths, and migration, is coded "1" if the data are held by official and other reliable sources to be substantially accurate, "2" if the components of natural increases are substantially adequate but the adjustment for migration either is not made or is based on inadequate information, "3" if the birth and death data are of unknown reliability, and "4" if they are known to be deficient. In the case of "3" or "4", the quality of the migration data is disregarded.

The second type, mathematical interpolation or extrapolation of two or more population counts, is on the whole an inferior method as compared with the first type, except in cases where vital statistics or migration data are deficient. The type of curve selected and the length of the intercensal or postcensal interval also have some bearing on the accuracy of the estimates obtained. Since the availability of more than two census counts gives more information on past trends in population growth and more latitude in the choice of curves, a distinction is made between countries having had at least three censuses since 1900 (coded "5") and those having had less than three (coded "6").

The third type of adjustment, an assumed rate of increase not derived by mathematical interpolation or extrapolation, is coded "7". Estimates obtained in this way may contain large errors, especially if the process is continued over a long period of time. However, this is a method that, in general, is applied only in cases where

neither the base data nor available information on population change permit the use of a more reliable method.

An estimate held constant at the value for the base date (coded "8") is usually of the lowest order of reliability. It often represents lack of information both as to population size and as to rates of change.[3]

Reliability of code: The various combinations of letters and numerals do not lend themselves to a precise gradation from the most reliable to the least reliable. This is so not only because of the factors mentioned in the preceding paragraphs, but also because a given set of estimates may have a favourable position with respect to one part of the code and a less favourable position with respect to the other part. It is difficult, if not impossible, to rank such cases on a reliability scale. However, it may be stated with some certainty that combinations of "R", "A" and "B" with "0", "1" and "2" indicate a relatively high level of reliability, that combinations of letters and numerals at the lower end of the scale indicate a low level of reliability, and that other combinations represent a rather wide variation in levels of reliability.

Applicability of code: Although the code appears in Table 1 only, it refers to the estimates for 1952-1954 wherever they appear. If the method for one of these years differs and has been ascertained, the appropriate code is given in a footnote to Table 1. Moreover, even if the method for constructing the other estimates could not be ascertained definitely, it is probably safe to assume that the classification given applies throughout the post-war series 1947-1953, for countries are generally consistent about the methods used in successive years.

Accuracy of statistics classified by age and sex

Certain irregularities appear in the age-sex statistics of many countries. These include: (1) underenumeration of infants and young children, (2) heaping at ages ending in 0 and 5, (3) a preference for even ages over odd ages, (4) unexpectedly large differences between the numbers of males and females at certain ages, and (5) unaccountably large differences between the numbers in successive or adjacent age groups. Some of these irregularities are obscured or eliminated when the data are combined into 5-year age groups, but the underenumeration of young children, the aberrations in the sex ratio, and some of the fluctuations in numbers generally are still apparent.

Comparison of statistics for identical age-sex cohorts, at successive censuses, as well as study of the age-sex composition at each census, indicates these and other inconsistencies, some of which are characteristic of even the most "modern" censuses. Examination of the data on age and sex, presented in this and earlier issues of the *Yearbook,* has shown that in some cases the statistics are particularly faulty in these respects.

During 1952, a test of the general accuracy of census statistics of the population classified by age and sex was developed. The validity of this test rests upon the knowledge that, except where abnormal conditions have obtained, sharp fluctuations in numbers among successive 5-year age groups or sharp fluctuations in the sex ratios are indicative of inaccuracies in age reporting.

The two major difficulties of applying the test lie in the determination of limits of tolerance for such fluctuations and in the incompleteness of available knowledge concerning the existence of abnormal conditions in the history of the populations under analysis. Because of these considerations, the age-sex distributions tested have been grouped in broad categories with a liberal allowance for fluctuations attributable to chance and to other deviations from expected patterns. In cases where unusual circumstances were known to have been operative (e.g., depletion of males in certain age groups because of war casualties or distortions resulting from international migration selective as to age or sex), the affected age groups have been omitted from the computations.

The scores were obtained in the following manner:

1. Age ratios were computed separately for each sex by dividing each 5-year age group between the ages of 5 and 70 by the arithmetic average of the two adjacent 5-year groups. Percentage deviations from a ratio of one were summed algebraically and averaged, the results giving an age-ratio score for each sex.

2. Sex ratios (i.e., the number of males per 100 females) were computed for each 5-year age group between the ages of 0 and 70, and the first differences were obtained. The mean of these differences (without regard to sign) is the sex-ratio score.

3. Age-ratio and sex-ratio scores were combined, by addition, to obtain a total score for the given age distribution, the sex-ratio score being given a weight of 3. Certain adjustments in scoring were made where part of an age distribution was given in 10-year age groups. In the case of small populations, allowance was made for the chance fluctuations of small numbers. Distributions that totalled less than 5 000 were not scored.

Computations for a large number of age distributions with a wide variation as to population types yielded a tentative classification, as follows:

		Score
I.	Data subject to minor, or only moderate, fluctuations	under 20
II.	Data subject to relatively severe fluctuations	20–39.9
III.	Data subject to extreme or markedly severe fluctuations	40 or more

For a more detailed account of the theoretical considerations underlying this method of testing age accuracy, the reader is referred to an article entitled "Accuracy tests for census age distributions tabulated in five-year and ten-year groups" appearing in the second issue of the *Population Bulletin.*[4] The results of the application of the method in evaluating the relative accuracy of the census age distributions published in the 1949-50 and 1951 issues of the *Demographic Yearbook* are published in the above article, while the application of the test to data published in the 1952 *Yearbook* is published therein. The results of the test as applied to the census data presented in Table 3 will be published in a later volume.

DESCRIPTION OF TABLES

Table 1

The first table in the *Yearbook* presents data on the total population, area and density of all parts of the world. The results of the latest population census, as well as midyear estimates for the pre-war year 1937, and for post-war years 1952, 1953, and 1954, are shown for each political or administrative unit for which official figures were available. In a few cases, unofficial estimates are shown for 1953 in order to obtain complete geographic coverage for at least one year and to give some idea of the magnitude of the population of every area. Such unofficial estimates are identified in the table by a symbol (x). The only other deviation from the general description of the table is that a population figure presented as the calendar "midyear" estimate is sometimes a mean of two successive end-year (31 December) estimates rather than one prepared specifically for 1 July. No distinction is made between these two types of midyear estimates on the assumption that the difference involved is negligible. Estimates relating to a date other than the midyear are, however, footnoted in the table.

Stub

The stub of Table 1 is the most complete geographically of any table in the *Yearbook*. In so far as possible, an attempt is made in this table to show for every "group" area its component parts. In previous issues, data relating to component parts of a larger geographic entity were shown enclosed in parentheses in order to indicate that they were included in the country totals immediately above them. To simplify the presentation in this *Yearbook,* the parentheses have been deleted and the component geographic units are here distinguished by smaller type size. Where it is not feasible or convenient to show the components separately, footnotes explain the inclusions. Additional notes have been inserted this year on Portugal and Spain to explain their off-shore departments or provinces; French and Portuguese India are now described, as is French Oceania.

Table 1 also presents areas identified as to their political status, i.e., as sovereign, non-self-governing, trust territories, condominiums, or those under international or military government. In so far as possible, the designations reflect the situation as of 1954. However, it was not possible for changes occurring late in 1954 to be incorporated in this issue. Such changes, including the October revision of the administration of Trieste and the November transfer of administration of French India, are described in footnotes, while the areas in question appear in their early 1954 status. When a revision of status would entail an inter-continental shift, as for example the incorporation of Greenland as a Department of Denmark, the change has also been described in a footnote without change in arrangement. Even though the Federation was effected in 1953, the Rhodesias and Nyasaland are still shown separately for convenience in presentation, since the statistical series are not yet combined. The status classification, together with the extensive footnotes which describe the areas in a detail not found elsewhere in the *Yearbook,* makes Table 1 the reference table of the volume in respect to area composition.

Census data

In so far as possible, the figures presented in the census column of Table 1 are confined to the population actually enumerated at the most recent "true" census whether or not this population represents the entire geographic area, a part of the area, or only a segment of the population. In general, a "true" census has been understood to mean one conducted with individual or family schedules, although a few "group" censuses have been included when it is known that these have been conducted on a scientific basis. Official estimates for excluded groups and for underenumeration are shown in footnotes when known.

Estimates

Unless otherwise indicated, the estimates of population for 1937 and each year 1952-1954 relate to the modified present-in-area population (see "Scope of Data," p. 9). The "Type of Estimate" code, which also has been described above, is included in this table and is applicable to each of the official estimates 1952-1954 unless there is specific limitation shown in a footnote. The information on underenumeration referred to above, together with this "Type of Estimate" code, furnishes the basis for a fairly precise evaluation of the official estimates of total population for post-war years which appear not only in this table but in Table 2 also.

In the absence of an official population estimate, Table 1 presents a census figure, if an appropriate one is available. Census data in the estimates columns appear in italics in order to distinguish them from midyear estimates.

Area and density

The area figures, given in square kilometres, relate to the total area of the specified geographic units, including inland water as well as such uninhabited or uninhabitable stretches of land as may lie within their boundaries. Wholly uninhabited areas, such as the polar regions and a few small islands, are not listed in the table and are, of course, excluded from the statistics. Area estimates are official unless marked with the symbol "x." Areas reported in square miles have been converted to square kilometres.

The differences between the area figures in this volume and those shown in the corresponding table of the last issue of the *Yearbook* are relatively small and may be assumed to result mainly from remeasurement and improved estimates, though in a few cases, actual changes in land surface have been effected through land recovery and construction.

Density, or the number of persons per square kilometre of total area, is shown for all geographic units. In previous issues, densities have been computed only for geographic units having an area of 1 000 or more square kilometres. Removal of the limitation results in the inclusion of densities for over 50 additional areas.

Another change introduced in the density calculation is the use of a 1952 estimate of population as the base if a 1953 figure were not available. Since the relative magnitude of the density is normally not sensitive to small change in the size of the population, a density based on a 1952 estimate will give good results. Density values are in any case no more than rough indices, inasmuch as they do not take account of the distribution or concentration of population within selected areas.

Table 1A

This table presents estimates of world population by continental divisions and regions at decennial intervals 1920 to 1950 and in 1953, together with data on the area in square kilometres, and, for 1953 only, the number of persons per square kilometre.

The regions have been delineated in terms of present *de facto* boundaries and all retrospective figures, having been adjusted for boundary changes, refer to constant areas. The 13 regions for which data are shown are constituted as follows:

1. Northern Africa: Spanish West Africa, Spanish Possessions in North Africa, Morocco, Tangier, Algeria, Tunisia, Libya, Egypt, the Sudan, Eritrea, Ethiopia, the Somalilands.

2. Tropical and Southern Africa: the remainder of Africa.

3. Northern America: Alaska, Canada, United States, St. Pierre and Miquelon, Greenland.

4. Middle America: the remainder of North America including the Caribbean.

5. South America: the entire continent.

6. South West Asia: Turkey, Iran, Iraq, Syria, Lebanon, Israel, Jordan, Cyprus, the Arabian Peninsula.

7. South Central Asia: Afghanistan, Pakistan, India, Nepal, Bhutan, Ceylon, Maldive Islands.

8. South East Asia: Burma, Thailand, Indochina, Malayan Peninsula, Philippines, Indonesia, remaining islands south of the mainland.

9. East Asia: the remainder of Asia, except the Asiatic part of the USSR.

10. Northern and Western Europe: Scandinavian countries (including Finland and Iceland), United Kingdom, Republic of Ireland, Channel Islands, Isle of Man, Benelux countries, France.

11. Central Europe: Germany, the Saar, Switzerland, Austria, Liechtenstein, Czechoslovakia, Poland, Hungary.

12. Southern Europe: the remainder of Europe, except the European parts of the USSR and Turkey.

13. Oceania.

Estimates

In view of the quite considerable amount of new information made available as a result of the 1950-1951 census programme, and because of the accumulation of various other types of information since estimates for the period beginning in 1920 were last prepared (see Chapter II of the *Demographic Yearbook 1949-50*), the entire series was revised for presentation in the 1952 and 1953 issues of the *Yearbook*. The present table maintains unchanged these 1920, 1930, and 1940 estimates, while the one for 1950 has been further revised in the light of information received during 1954. The 1953 estimate is new.

Because of the uncertainty of knowledge with respect to many segments of the world's population, the estimates are shown as ranges within which the actual numbers probably fall. For the convenience of users of the data, the mid-values of the ranges are also shown. The relative spread of the ranges above and below the mid-values varies in accordance with carefully developed estimates of the accuracy of the base data, the range being so small for Northern and Western Europe that, when rounded, one terminal value coincides with the mid-point. The absolute range in continental and world totals is in each case less than the difference between the sums of the minimum and maximum estimates of the components for the reason that it may be assumed that the errors of estimate in the components tend to compensate one another.

It should be noted that in developing the estimates for this table, an allowance for underenumeration at the various censuses has been included wherever possible. The regional and continental sub-totals do not, therefore, necessarily coincide with those which would result from summing the component parts in Table 1, although with one exception the sub-totals from Table 1 fall within the range shown in Table 1A.

Area

The regional, continental, and world totals for the area in square kilometres were obtained by summing the figures for individual geographic units shown in Table 1; they, therefore, include inland waters but exclude certain polar regions and a few small uninhabited islands. In some cases, they also differ slightly from those shown previously, due primarily to remeasurement, improved estimates, or reclaimed land.

Table 2

Official estimates of total population for the period 1920 to 1954 are presented in Table 2 for 181 geographic areas. For 1920 to 1935, estimates are quinquennial while for 1940-1954, they are annual.

Time reference

Unless otherwise indicated, all estimates relate to the modified present-in-area population (see Scope of Data, p. 9) at the midpoint (1 July) of the specified calendar year. In cases where official estimates were available for 31 December only, the arithmetic mean of two consecutive end-of-year estimates was computed and is presented in this table as the midyear estimate. In some previous issues of the *Yearbook*, estimates for 1 July were distinguished from means of end-year or of monthly or quarterly estimates by notations in the table. This distinction is not made in the present table on the assumption that the difference involved is negligible. In a few cases, where official estimates are regularly prepared for a date other than 1 July or 31 December, the official figures are given in the table with a note indicating the date to which they refer. In years for which the results of a current enumeration, as well as an estimate, were available, the census figure has sometimes been preferred to a midyear estimate, regardless of the census date, if the two figures appeared not to be in sufficient agreement. Census returns have also been included when there was no corresponding estimate for the year in question. Wherever census counts are shown in the table, they appear in italics for easy identification.

Unrevised estimates

In a number of cases where the results of censuses taken in 1950, 1951, or 1952 are only recently available or are still in a preliminary stage, intercensal estimates have not yet been revised and brought into agreement with the new population counts. In some of these series, the need for revision is obvious; in others, only minor fluctuations are implied by the unrevised data. Series which show an irregularity of this type are marked with a section mark (§).

Table 3

Statistics of the population classified by sex and age in 5-year groups are presented for 60 areas in Table 3. Unlike the corresponding table in the 1953 issue of the *Yearbook,* which contained all distributions of population by age and sex available as a result of censuses taken in 1950, 1951, or 1952, Table 3 presents only recent censuses or estimates not previously published in the *Demographic Yearbook.* It, therefore, supplements the 1953 version of the table and should be used in conjunction with it to obtain a broad coverage of 1950-51 census results classified by age and sex.

A number of areas for which the tabulation published in the previous *Yearbook* was provisional or based on a sample, have now completed the final tabulation. These final figures have been substituted for the provisional distributions previously shown. Unless otherwise noted, the data relate to the present-in-area population of the geographic areas indicated.

In the absence of information to the contrary, it is assumed that data in the table relate to age in completed years, i.e., age at last birthday. However, age-sex distributions of population are known to suffer from certain deficiencies which have their origin in underenumeration of infants and in irregularities in age reporting. A discussion of these irregularities together with a description of the procedures for testing age accuracy is given on p. 12 above. The classification of age distributions of population by this method will be found in *Population Bulletin*[5] and in the 1952 issue of the *Demographic Yearbook.*

Table 4

Table 4 presents the formally married and the consensually married population by age and sex at two or three censuses taken since 1928, and gives the percentage that these marital-status classes constitute of the total population in each age group. For this table "married" comprises persons reported at the census as "married" or "separated" and excludes those reported as "single," "widowed," "divorced," "consensually married" and "not stated." However, when the consensually married group were not tabulated separately they were sometimes considered as "married" in the census tabulation. Such cases are noted in the table.

Limitations of the data

The classification of consensual or "common law" marriages in countries where such unions are relatively numerous is an important consideration with respect to comparability of these data. If a census has not provided specific instructions for the treatment of this group, some may be reported as married, others as single. Even with appropriate instructions, however, the classification of these individuals is probably only partially controlled, since errors in response would still be a heavily contributing factor. It would seem that partners of consensual unions are more likely to report themselves as married than as single. Because they are, from the demographic point of view, in fact married, the United Nations Population Commission has recommended that they be so classified. A few countries classify them as "single," however, with resulting very low proportions in the category "married."

Similarly the category "separated," unless it includes only persons who have been separated by legal process, is of uncertain composition, being likely to contain married persons who are simply living apart and who may or may not intend to remain apart. But in any case, since laws and practices with regard to legal separation differ within and among countries, genuine comparability for this group is probably out of the question. Because of the difficulties involved in obtaining accurate and comparable statistics, separated persons are generally included in the category "married." Some countries find it useful to distinguish the two sub-groups, "married, spouse present" and "married, spouse absent," but even these data do not necessarily reflect permanency of separation.

As in Table 3, the age classification relates to age at last birthday. Since these data are for a selected older age group, they are not likely to be seriously underenumerated but they are subject to the irregularities in age reporting described on page 12. Data are presented for 121 areas.

Tables 5 and 6

Statistics on women 15 years of age and over, classified according to the number of live-born children they are reported to have borne and, separately, by the number of children reported as still living at the time of the census, are presented in Tables 5 and 6. These are census statistics, and are therefore available only at the time of a population enumeration.

It will be noted that Table 5 (children born) includes data for 65 areas, while in the 1949-50 *Yearbook,* where it was last previously presented, it covered only 26 areas. This increase in coverage indicates that, although data of this type are not universally obtained, they are becoming more widely available. Information on women by children living is available for a smaller number of countries.

In these tables, age is classified in 5-year groups from 15 to 49 with a terminal group of 50 years and over. Number of children reported is given as 0, 1, 2, 3, 4, 5, 6-10, 11 and over, and unknown. For analytical purposes it would be more desirable to show age-groups up to 75 and over and number of children separately up to 9 and in groups of five to 20 and over[6] but the needed detail was not available in a sufficient number of cases.

In addition to the female population by number of children borne and living, Tables 5 and 6 show the total (aggregate) number of children reported by the women in

[5] *Ibid.*

[6] Report of the Population Commission (Fourth Session) Document E/1313, 21 April 1949, Annex 2, p. 22.

each age group, and the ratio of these children per 1 000 women in each group. Since these aggregates are computed on children reported, they are based on an assumption that women in the "unknown" category are equivalent to reports of 0 children. Therefore the ratios of children born or living per 1 000 women are computed in relation to all women, including those with number of children not stated.

Limitations of the data

International comparability of these data is somewhat limited by variations among countries in the groups of women to which these statistics refer. The table is defined as relating to all female population, 15 years of age and over. In some cases, however, the data are for all women who have ever been married; in other cases they refer to "mothers" (that is to women who have borne children); in still other cases, the data are said to relate to women reported as "married." Some of these variations introduce a secondary difference in the base data, in that "married women" may report "legitimate" offspring only. In still other cases, stillborn issue may be included. These variations are noted in the tables, together with variations in the age structure tabulated.

There is also considerable variation in the proportion of women concerned for whom the number of children is not stated. As noted above, these variations particularly affect the ratios of children to women, shown in the last column of the table, because of the assumption inherent in the data that "children not stated" is equivalent to 0 children. Consequently, except for comparisons between areas where the group of women covered is the same, and where "unknowns" are unimportant, the ratios cannot be used for international comparisons of levels of fertility. They can, however, be utilized for comparisons of general trends or of relative differences between age groups.

In interpreting the data, it should be borne in mind that the number of children reported by older women in some countries is believed to fall short of the true figure. Stillbirths (where these are covered by the data) and children who died soon after birth are especially likely to be omitted. The ratio between children ever born and children living, for countries where both types of data are available, is particularly affected by such omissions. In fact, unusually large differences may be taken as evidence of this sort of omission.

Table 7

A common measure of fertility, especially where adequate vital statistics and other types of direct information are lacking, is the ratio of children under five years of age to women in the child-bearing ages. Table 7 presents these ratios for 152 areas derived from censuses taken between 1900 and 1952. The ratios are expressed as the number of children per 1 000 women aged 15 to 49 years. In one sense these ratios are a refinement of ratios for ages 15 and over shown in Table 6. The former, derived from a report by each woman of all children now living, are expressed per 1 000 women 15 years of age and over, while the ratios in Table 7 are the number of children reported as under 5 years of age at the census, per 1 000 women age 15 to 49 inclusive.

Limitations of the data

Interpretation of such ratios is usually based on the presumption that differences between countries reflect differences between them in the rates at which births occurred to women of child-bearing age in the five years before the census. However, the ratios shown are strongly influenced by other factors. The most important of these are deficiencies in the censuses. As indicated in the section on age composition, it appears that in most censuses, a greater proportion of young children is omitted from the count than of older persons. The number of young children recorded in the tabulations is also affected by rounded statements of age with the result that some children under 5 may be mistakenly included among those who are 5 or over. The ratios shown in the table are, therefore, without doubt somewhat lower than they would be if census data on age were fully accurate. On the whole, they are probably less deficient in the countries where they are low, since many of these countries have good statistics, than in countries where they are higher. However, in areas where people generally do not know their ages, it is possible that the ratios may be too high. In any case, as concerns countries with poor census data on age (and many of the countries with high ratios fall into this category) even fairly large differences in the ratios may be due mainly or entirely to deficiencies in the data.

Another factor affecting the ratios is mortality. Even if the data were completely accurate, the ratios would not necessarily correspond closely to the rate at which births have occurred to women of child-bearing age in the years before the census. The number of children under five living at a given time is the number who have survived among children born during the preceding five years. The ratios therefore invariably understate actual fertility levels. Furthermore, death rates at these ages vary widely from one part of the world to another. Areas of high fertility tend also to be areas of high mortality. Consequently, the ratios for such areas are more affected than those for areas of low fertility and mortality and the gap between countries with high and those with low ratios is narrower than the gap between them in the frequency of birth. However, ratios of children to women of child-bearing age are more useful for some types of analysis than ratios of births to women of child-bearing age. If one wishes to study the rate at which the older generation is likely to be replaced by its offspring, children who die in infancy are irrelevant. From this point of view, differences in infant mortality do not affect the comparability of the ratios shown.

VITAL STATISTICS

EVALUATION OF QUALITY OF DATA

Coverage of events—registration and reporting

For purposes of the *Demographic Yearbook,* vital statistics, which are presented in Tables 8 to 35, have been limited to statistics of live birth, death, stillbirth (late foetal death), marriage, and divorce. This coverage is in accord with that recommended in Principle 201 of the United Nations *Principles for a Vital Statistics System*[7]

[7] United Nations. Statistical Office. *Principles for a Vital Statistics System.* Statistical Papers, Series M, No. 19, New York, August 1953, 28 pp.

which, in addition, includes within the field of vital statistics, statistics of early and intermediate foetal deaths, adoptions, legitimations, recognitions, annulments, and legal separations. The *Principles* referred to above are recommendations for the improvement and standardization of vital statistics which were adopted by the United Nations Statistical Commission at its seventh session in February 1953 and approved by the Economic and Social Council at its fifteenth session in April 1953 under a Resolution [469 (XV) D] which suggests, *inter alia,* that "governments review and appraise their procedures for registering vital events and compiling vital statistics, taking into consideration the *Principles for a Vital Statistics System,* and introduce such changes as are feasible to improve national statistics and their international comparability in the field."

Despite the fact that live births, deaths, foetal deaths, marriages and divorces have been recommended by the United Nations as having priority in registration and reporting, the availability of statistics on these events varies widely, due in part to differences in the coverage of national legislation. In some areas, registration is not compulsory for all of the five events; in others, it is compulsory for only a part of the population (e.g., "European" or "non-indigenous" population in certain African territories). In other countries, such as India and Pakistan, there is no compulsory provision for registration on a national basis, but only municipal or state ordinances which do not cover the entire geographic area. Still other countries (e.g., Gold Coast) have developed "registration areas" which comprise only a part of the country, the remainder being excluded for reasons of inaccessibility or because of economic and cultural considerations that make regular registration a practical impossibility. An examination of the tables will show that the coverage for Africa is particularly spotty, being confined largely to data on the "European" population with, as a rule, only a few partial statistics for the indigenous segments. Similarly, the coverage is uneven and the statistics incomplete for much of Asia and parts of Latin America.

All of these variations in the applicability of the compulsory registration provision are not in accord with the "Compulsory Nature of Registration" recommended by the United Nations,[8] which reads as follows:

> (*a*) In accordance with priorities established under Principle 201, registration of every vital event occurring within the boundaries of the country should be made legally compulsory for every group of the population and parallel provision for enforcement should be established.
>
> (*b*) Supplementary arrangements on a non-compulsory basis for registration of events among national residents who are temporarily abroad may be provided at the national level.
>
> (*c*) The efficiency with which these provisions operate or may be presumed to operate should not be a factor in their establishment.

Experience has shown that, despite the manifest difficulties of registration and the unreliability of the data reported, it is only with the initiation of the obligation to register that improvement begins to occur. Voluntary registration has never produced complete registration.

Statistical definition of events

Another source of variation, especially in the statistics of live birth, death, and stillbirth, lies in the statistical definition of these three vital events. Prior to 1950, "stillbirths" were defined internationally[9] as follows:

> A dead-birth is the birth of a foetus, after at least twenty-eight weeks pregnancy, in which pulmonary respiration does not occur; such a foetus may die either: (*a*) before, (*b*) during or (*c*) after birth, but before it has breathed.

The uniform and definite criterion by which a stillbirth could be differentiated from other products of human gestation not yet at a stage of development where they could normally be expected to be capable of existence independent of the mother, was necessary to ensure the accuracy and comparability of stillbirth statistics, as distinct from statistics of "abortion" or "miscarriage". However, from the viewpoint of accuracy and comparability of live-birth and death statistics, it is more important to establish a uniform and definite criterion differentiating between stillbirths and live births. Variations in registration procedures may have an important effect in this regard. In some countries, namely Spain, Cuba, Honduras, Bolivia, Ecuador, and the Spanish possessions of Ceuta and Melilla, registration as a live birth requires that the child first have survived 24 hours of life. Infants who die before the expiration of the 24-hour period are, therefore, classified as *abortos* and, failing special provisions, would not be counted statistically as live births or as deaths. Likewise, in several countries, those infants who are born alive but who die before registration of their birth, irrespective of the age at death, are considered as "stillbirths" and are included in neither the live-birth register nor the death register. In still other countries, such infants are registered as "deaths" but not as live births. As noted in connexion with deaths prior to 24 hours of age, unless special tabulation procedures are adopted—as they are in the Netherlands, for example—the live-birth and death statistics are deficient by the number of these infants, and the stillbirths are increased. As a result, stillbirth ratios are exaggerated and general birth and death rates are understated to some degree. The infant mortality rate is also affected for, although both the components of the rate are deficient by the same absolute amount, the rate nevertheless tends to understate actual mortality because the deficiency is proportionately greater in relation to the number of infant deaths than in relation to the number of births.

Lack of comparability due to different statistical definitions is found also in statistics of marriage and divorce. Because, as noted below, marriage and divorce are legal rather than biological events, the composition of the statistics reported can be a source of variation between countries. In some countries, statistics of legal marriage refer to religious ceremonies only; in others, they refer to civil marriages only; and in still others, both civil and religious ceremonies are considered legal marriages. In

[8] *Principles for a Vital Statistics System, op. cit.,* Principle 203.

[9] League of Nations. Health Committee. *Report of the Committee Studying the Definition of Dead-Birth.* C.M.1925. C.224. M.80. Appendix 2, p. 78.

all countries, non-registered unions generally known as "consensual", "common law", "customary", and so forth, are automatically excluded, but non-comparability of statistics of marriage formation in the demographic sense results because the proportion of such unions varies widely from country to country. For the same reason, "marriageable" and "married" population on which specific marriage and divorce rates are computed may be non-comparable.

International recommendations

Problems of comparability stemming from these sources will be lessened as international standard definitions and classifications are adopted. Some progress in developing standards was made by the Expert Committee on Health Statistics of the World Health Organization which, in 1950, recommended uniform definitions of live birth, foetal death, and stillbirth for adoption by the various countries. This progress was carried still further and broadened to cover other vital events when the Economic and Social Council of the United Nations approved the *Principles for a Vital Statistics System,*[10] one of which sets forth standard definitions for statistical purposes of each event on which data may be collected by the registration method. This recommendation, which has as its aim the elimination of the lack of comparability mentioned above, reads in part as follows:

> 202. *Definition for statistical purposes of each event on which data may be collected by the registration method*
>
> (*a*) The definition of each event on which data are collected for vital statistics purposes should conform, in so far as possible, with the definitions for statistical purposes given in paragraph (*c*) below.
>
> (*b*) If a legal concept or definition in any country cannot be harmonized with these, provision should be made to report the events as defined below or in accordance with definitions which do not differ in principle from those below. If this is impossible, full description of divergencies should be given wherever statistics of these events appear.
>
> (*c*) The recommended statistical definitions are as follows:
>
> (1) Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached; each product of such a birth is considered live-born.
>
> All live-born infants should be registered and counted as such irrespective of the period of gestation or whether alive or dead at time of registration, and if they die at any time following birth they should also be registered and counted as deaths.
>
> (2) Death is the permanent disappearance of all evidence of life at any time after live birth has taken place (post-natal cessation of vital functions without capability of resuscitation). This definition therefore excludes foetal deaths.
>
> (3) Foetal death is death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the foetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.
>
> (4) Stillbirth is defined as synonymous with late foetal death, that is, one of twenty-eight completed weeks of gestation or over.
>
> (5) Marriage is the legal union of persons of opposite sex. The legality of the union may be established by civil, religious, or other means as recognized by the laws of each country; and irrespective of the type of marriage, each should be reported for vital statistics purposes.
>
> (6) Divorce is a final legal dissolution of a marriage, that is, the separation of husband and wife by a judicial decree which confers on the parties the right to civil and/or religious remarriage, according to the laws of each country.

This Principle includes as well definitions of "adoption", "legitimation", "recognition", "annulment", and "legal separation", but since statistics on these events are not presented in the *Yearbook,* the defintions are not included here. There can be no doubt but that adoption of the standard definitions will go a long way toward eliminating the variations of this type which are now present in the tables.

Completeness of data

Quality Code

Apart from the variations which arise as a result of lack of uniformity in national legal provisions for registration, there are also differences in the effectiveness with which similar laws operate in the various countries. The questionnaires through which the United Nations obtains from the national statistical offices the data presented in these tables include not only requests for statistics but also enquires as to the completeness and accuracy of the data returned. On the basis of the replies to these enquiries, and in the light of the results of a search of relevant official publications, it has been possible to classify national vital statistics into three broad categories: (1) those stated to represent a complete, or virtually complete, coverage of the events occurring each year; these are coded "C"; (2) those stated to represent an incomplete coverage or to be subject to considerable irregularity of registration, which are coded "U"; and (3) those concerning which no information is available, for which the symbol of three dots ". . ." is used. The results of this classification appear in the first column of the trend tables 8, 9, 28, 31, 32, and 34 which show for live births, deaths, infant deaths, marriages, and divorces total frequencies and rates.

Applicability: Despite the fact that the code is published only in connexion with the trend tables, it is applicable to the vital statistics for the country in question wherever they may be found in the *Yearbook*. Thus, in using data from Tables 8 to 35, reference should be made to the quality code before any comparisons or analyses are attempted, although in the case of life-table functions (Tables 36-38), adjustments have usually been made for deficiencies in the basic data. The reliability

[10] *Op. cit.*

code relates specifically to the vital statistics and not to the population base used in the computation of the rates. However, the validity of the two components of the rate is interrelated, particularly where vital statistics have been utilized in the preparation of the population estimates. A fuller evaluation of the rates may be made by referring also to the "type" code on the population estimates presented in Table 1.

It is important to remember also that, although in a considerable number of cases the statistics maintain a high degree of accuracy throughout the period covered, in general, the code is consistently applicable only to recent data. In the early years, many of the series are considerably less reliable than the code implies and, in some such cases, when the country in question has specifically evaluated the situation, a footnote has been appended to qualify the code. Such notes will be found for the Dominican Republic, Mexico, Panama, Poland, and Yugoslavia among others.

Information on the quality of the vital statistics is lacking for a considerable number of areas, but it is safe to assume that, for many of these, the reliability is open to serious question. The symbol ". . ." appearing in the code column should, therefore, be taken, in general, as a warning that the accompanying data probably should be approached with caution. An examination of the computed or implied rates for these areas will indicate the cases for which a presumption of incompleteness is probably justified. However, this applies only with respect to areas where the data are markedly deficient. It should be remembered that knowledge of "expected" levels of fertility, mortality, and nuptiality is extremely scanty for many parts of the world and that borderline cases, which are the most difficult to appraise, are frequent.

Improvement over the years in the coverage of vital events through improved registration is a limiting factor to comparability in time. Such improvement tends to mask actual trends in the incidence of birth, death, or marriage. For example, a steadily rising trend in crude birth or crude death rates over the period covered by the data shown in this *Yearbook* is quite likely to indicate improvement in coverage rather than a rise in fertility or mortality. Rising stillbirth ratios are also likely to indicate improved registration. Furthermore, temporary measures, such as the removal of registration fees in order to encourage registration, may cause the numbers to rise sharply in certain years. Where tabulations include delayed registrations, the fluctuations are particularly violent. When factors of this type are known to be operating, they are noted in the tables. As the information given in the code columns and in the footnotes makes clear, some of the material presented in the tables is useful, not as a measure of actual levels and changes, but rather as an indication of where registration systems are in effect and as a record of progress toward a more complete registration of vital events.

Limitations: The way in which the classification with respect to reliability was made did not permit the application of uniform objective criteria. In many cases, the basis for the country's own evaluation of the data was not given. Nevertheless, it was felt that under the circumstances national statistical offices were in the best position to judge the quality of their data and that even the very broad categories that could be established would be useful in furnishing some indication of the validity of the statistics presented in this *Yearbook*. More objective evaluation on the part of national governments is specifically recommended in Principle 106 of the *Principles for a Vital Statistics System*,[11] which reads as follows:

> *106. Critical evaluation of the vital statistics system*
>
> (*a*) As a supplement to co-ordination, responsibility for the establishment and execution of methods for critical evaluation of the vital statistics system should be vested in a designated authority.
>
> (*b*) The elements of the evaluation programmes will vary in detail according to the degree of development of the system, but should include at some stage intensive studies of the degree of completeness of registration and of statistical reporting of events, with a view to evaluating the quantitative accuracy of vital statistics; analysis of the completeness and accuracy with which items of information relating to an event are recorded; determination of the success with which the tabulation programme meets the needs of consumers in terms of timeliness, adequacy and quality of statistics, and the general efficiency with which the system operates.

It is hoped that, in the future, further progress can be made toward a more uniform, objective, and detailed appraisal of these data.

Tabulation procedures

Present-in-area population

As indicated previously and in accordance with part (*c*) of vital statistics Principle 409,[12] vital statistics shown in this *Yearbook* relate to the *de facto* or present-in-area population, and footnotes are used to show deviations from this concept. The only exceptions to this footnoting rule occur in Tables 28, 29, and 30 in which the disposition of the deaths among the armed forces is explained in so far as possible, irrespective of whether such disposition is or is not a deviation from the present-in-area concept. Thus, unless otherwise noted, all vital statistics tables include events occurring within the present boundaries of the geographic areas shown and among all segments of the population.

The need for distinguishing between statistics for areas or peoples where registration is moderately complete and those in which it is incomplete has been recognized in vital statistics Principles 402 and 403[13] which recommend the establishment of "tabulation areas" (defined as "geographic areas which meet certain national criteria for completeness of registration and data coverage, and on which, therefore, national tabulations are based") and separate and limited tabulations for important population groups in which registration is incomplete, or the quantity or quality of original data very deficient. In line with these *Principles*, statistics for some countries

[11] *Ibid.*

[12] (*c*) Tabulation of data for the national territory should relate in general to data on events occurring within the national boundaries, although under certain circumstances, as for example during war years, provision may need to be made for including in the national tabulations data for deaths among the armed forces stationed outside the national boundaries.

[13] *Principles for a Vital Statistics System, op. cit.*

regularly exclude data for a segment of the population in which registration, though compulsory, is not even moderately complete, or for which the statistics are not reliable. Countries which follow this procedure include among others Panama and Venezuela, where vital statistics exclude those for tribal Indians; Peru, whose jungle population is excluded; British Guiana, Surinam, Formosa, and Australia, where statistics for aborigines are not included. Whenever the geographic area or population covered by the statistics is less than the entire country, the deviations are noted in the tables.

Tabulation by data of occurrence

In so far as possible, the data presented in these tables refer to events which occurred during the specified year rather than to events which were registered during the period. This is in accord with the vital statistics Principle[14] on this subject which states:

> *408. Tabulation by date of occurrence or date of registration*
>
> (*a*) Final tabulations for any calendar period should be based on events which occurred during that period and not on those registered. Should it be administratively necessary to tabulate final figures by "date of registration" rather than "date of occurrence", evaluation studies should be made to determine the degree to which tabulations by date of registration approximate those by date of occurrence, and it is desirable that the analyses of this relationship be published.

However, it will be noted that a considerable number of countries (see below) tabulate their statistics not by date of occurrence but by date of registration, thus including delayed registration in the statistics for the year when they were reported rather than in the year when the births, deaths or marriages occurred. When, within a country, the numbers of events registered from year to year fluctuate widely (due to *ad hoc* incentives or inducements provided to stimulate registration, or to the need for proof of birth or death to meet certain requirements), then vital statistics tabulated by date of registration rather than by date of occurrence will be misleading as indices of the number of vital events that actually occurred during the specified year or of the rate of occurrence. Similarly when the time allowed and/or elapsed between occurrence and registration differs markedly from country to country (as it does), then tabulating by date of registration will produce statistics which may not be comparable with those for other areas. An examination of the differences between countries in the time allowed for registration of the vital events will suffice to illustrate this latter point, especially when it is recognized that all registrations are not made within the legal period.

The time allowed by law for the current registration of a live birth varies from 1 day (24 hours) in some heavily populated areas of the United States of America to 62 days in New Zealand and 90 days in parts of Brazil distant from a registration office. Deaths are registrable within 24 hours in most countries, but the period varies, reaching 30 days in New South Wales and Queensland, Australia. Marriages are most often registered as part of the ceremony, but in other cases, as much as 30 days is allowed. Divorces are registered as part of the records of the court concerned as soon as the decree is granted, but in countries where a secondary registration is also made in the civil register, there may be a considerable time lag. In recognition of the multiple factors involved, the *Principle* (212) which has been set forth by the United Nations[15] on this particular point states that:

> The maximum period to be allowed between the occurrence and the obligatory registration of a vital event should be determined with respect to all the contributory factors operating in the country and should be as short as is consistent with the facilitating of the current and accurate registration of all necessary facts.

But, whatever the length of the legal period for registration, it is a well-known fact that delayed registrations are inevitable, and that statistics of current registrations often include events which occurred many years previously, especially in countries with less well-developed vital statistics systems.

Symbol: Because of the importance of this factor and in order that the user may be aware of a potential source of distortion in the statistics, the countries known to tabulate vital statistics by date of registration are identified by a dagger symbol (†). Information is not available for all areas shown in the tables, but those for which information is known fall into two groups as follows:

Geographic areas for which data are known to be on a "date-of-occurrence" basis

Albania	Luxembourg
Austria	Maldive Is.
Belgium	Monaco
Bolivia	Netherlands
Bulgaria	Norway
Burma	Pakistan
Canada	Panama
Czechoslovakia	Philippines
Denmark	Poland
Dominican Republic	Portugal
England and Wales	Romania
Finland	Saar
France	San Marino
Hungary	S. Korea
Iceland	Spain
India	Sweden
Indonesia	Switzerland
Iran	Taiwan
Italy	Union of South Africa
Jamaica	United States
Japan	W. Germany and Berlin
Jordan	Yugoslavia
Liechtenstein	

Geographic areas for which data are known to be on a "date-of-registration" basis

Argentina	Cuba
Australia	Ecuador
Ceylon	Egypt
Chile	El Salvador
Colombia	Guatemala
Costa Rica	Greece

[14] *Ibid.*

[15] *Ibid.*

Honduras
Ireland (Rep.)
Israel
Lebanon
Mexico
New Zealand
Nicaragua
N. Ireland
Paraguay
Peru
Scotland
Syria
Thailand
Uruguay
Venezuela

For areas not shown in either of the above lists, it seems probable that in most cases the data are on a date-of-registration basis. Where the areas involved are non-self-governing, it is likely that the procedures followed by the administering countries are also followed in the dependencies.

As provided in Principle 408,[16] some countries furnish preliminary statistics on a date-of-registration basis and final statistics on a date-of-occurrence basis. Where registration is prompt, the difference between the two figures for a given period is negligible.

It should be noted that, though this factor is important particularly in connexion with live-birth statistics where the legal registration periods vary widely and the actual time intervals between occurrence and registration even more, the symbol (†) has been included on all vital statistics tables except that of divorce. It is less applicable to death statistics than to natality because, by the demands of the sanitary code in most countries, deaths must be registered quickly in order to obtain a burial permit. It is even less applicable to marriage statistics because in most countries, marriages are registered immediately as part of the ceremony or, at least, within a reasonably short period. It is least applicable to stillbirth statistics because of the need for a burial permit and because delayed registration of stillbirths is probably non-existent.

DESCRIPTION OF TABLES

Live-birth statistics

Because this issue of the *Yearbook* is devoted to natality statistics, a total of 14 tables on the subject are included, beginning with Table 8. Unless otherwise noted, these data refer to live births, that is, stillbirths or other foetal deaths are excluded, illegitimate live births are included, and each member of a multiple birth is counted separately.

In general, the data presented relate to live births which occurred within the present boundaries of the given country and within the present-in-area population. Therefore, they may be presumed to include births among nomadic tribes and aborigines and those among displaced persons, war refugees, and aliens residing in the country at the time the birth occurred.

Limitations of the data

Deficiencies in vital statistics have been reviewed above where reference was made to the effect of varying definitions of events for statistical purposes, to the evaluation-of-quality code, to the effect of tabulating by date of registration rather than by date of occurrence, and so forth. One additional source of incompleteness exists for live-birth statistics, and that is the tendency in all countries, irrespective of their definition of stillbirth, to fail to include in the live-birth register some of the infants who, though born alive, die before registration of birth.

In most countries, the registrar is required by regulation to ascertain that for every infant-death registration there exists a corresponding live-birth registration. However, this regulation is sometimes limited in its application as, for example, in Chile where the registrar is obliged to verify the birth registration only if the infant whose death is being recorded is under 30 days of age. The legal period for birth registration in Chile is 60 days. But in all countries, some laxness in applying the regulation undoubtedly exists, especially for infant deaths at ages over one month. Therefore, it is likely that some live births will always fail to be registered in almost very country. In some cases, these infants may be considered as "stillbirths" and registered as such if stillbirth registration is provided, in which cases the statistics of live birth and of death will be deficient and the statistics of stillbirth inflated. In other cases, these unregistered live births will enter the death register but fail to be considered also as live births. In either case, the qualification should be kept in mind in using live-birth statistics, especially those for countries which provide a long period during which registration may be effected.

Table 8

This table presents the total number of live births reported for 183 geographic areas. Because this issue of the Yearbook emphasizes natality statistics, both the geographic and time coverage have been made as extensive as space would permit. Data are shown for each year 1938 to 1953. Major areas even though lacking recent data are included; smaller geographic units, where reported live births are few, are also included in order to give as broad geographic coverage as possible in the trend table. For the same reason, data for small segments of the population are presented when statistics are not available for the country as a whole.

Limitations of the data

In addition to the number of live births reported to have occurred in 183 geographic units of the world, Table 8 presents a quality-of-data evaluation which appears in the first column of the table in the form of a code "C," "U" or " . . .". The elements of the code and its interpretation have been described in detail on page 18 above. One further refinement which has been introduced this year is that for each area for which it is available, percentage measures of completeness have been given wherever such measures have been made available by the countries. Although these are not many, a measure of the completeness of live birth statistics is given for the areas given below. The measures relating to a specific year are based on a test of birth registration completeness carried out in conjunction with the census of population.

Alaska	92.1 in 1950
Canada	98.0 in 1941
Puerto Rico	86.5 in 1940
United States	97.9 in 1950
Argentina	97.0
Sarawak	80.0
Nicaragua	75.0
Peru	80.0
Honduras	98.5

[16] *Ibid.*

In using data from this table, care must be taken to consider also the effects of tabulation by date of registration rather than by date of occurrence; countries which are known to have adopted this basis of tabulation are marked in the table with a dagger (†). Whenever the lag between occurrence and registration is prolonged, i.e., where a large proportion of live-birth registrations are "delayed"—as in some parts of Latin America, Asia, and Africa—live-birth statistics by date of registration may give a very distorted or even wholly erroneous picture of natality trends.

Table 9

Crude birth rates, computed from data in Table 8, are presented in Table 9. The geographic coverage of this table is slightly less than that of the corresponding frequency table because in a number of cases, appropriate population estimates for the computation of rates are not available. In still other cases, the frequencies were considered too small to serve as a basis of reliable rates. This should not be considered as validating all the rates included, however. Series in which one rate was based on a frequency less than 50 are marked with a double asterisk (**).

Rate computation

Annual crude rates are the number of live births per 1 000 persons in the population estimated at the midpoint of the year or, in a minor number of cases, in the population at the date of the census or at some other point during the year. The five-year average rates are the sum of the live births in the period per 1 000 of the sum of the midyear populations for the period. In general, the population totals on which rates in this table are based are the official figures presented in Tables 1 and 2. Therefore, if rates for certain years do not appear in this table despite the fact that frequencies for these years are shown, it is usually because an official population is not available. On the other hand, rates may appear for areas not shown in Table 2 when they refer to only a part of the population in that table, or when the years for which rates can be presented are solely those already covered in Table 1. But, in general, reference may be made to Tables 1 and 2 for a definition of the type of population which constitutes the denominator of the rates shown in Table 9.

Limitations of the data

Rates shown in this table are subject to the limitations of the base data, set forth above in connexion with Table 8.

Irrespective of their limitations, crude birth rates do provide a measure of gross additions to the population through natality but, because of differences between countries in the age and sex composition of the population, these rates do not reflect very precisely differences in the frequency of births among population at the reproductive ages. They give only a general idea of trends over time and of differences between countries in levels of natality.

Table 10

Live births by age of mother for 84 geographic areas are given in Table 10 for the years 1936 to 1953. The age groups for which births are shown are "under 15," quinquennial groups to 44, "45 and over" and "unknown".

Limitations of the data

Data in this table are subject to the limitations implied by the code of completeness or incompleteness, "C," or "U," which was described in connexion with vital statistics in general and which appears in Table 8. Comparability is also affected by differences in the basis of tabulation, i.e., date of occurrence or date of registration. The dagger (†) in the stub indicates the countries which tabulate by date of registration.

One other computation factor must also be kept in mind in using these data. This is the variation which may result between countries which calculate age of mother at birth of child (or at registration) using the exact dates, i.e., day, month, and year, and those which use the year alone. Information on this factor is given when known.

Because these are statistics classified according to age, they are subject to the limitations with respect to accuracy of reported ages similar to those already discussed in connexion with population by age and sex. The absence of frequencies in the unknown age group does not necessarily indicate completely accurate collection and tabulation of the age item. It is often an indication that the "unknowns" have been eliminated by assigning ages before tabulation, or by proportionate distribution after tabulation. On the other hand, large frequencies in the "unknown age" category may indicate the inclusion of illegitimate births, for which the data on birth records are rarely complete.

Lack of strict comparability, both among data shown in this table and between those shown in this table and in Table 8, is due to a variety of causes. In certain instances, data by age in this table refer to deliveries or confinements rather than to live births; moreover, in some cases the confinement referred to are those resulting in live birth only and in others to those resulting in live-born or stillborn offspring. Other countries restrict tabulations by age of mother to legitimate births only, while totals of live births in Table 8 relate to all births, i.e., legitimate and illegitimate. In most cases, this limitation qualifies the data very little, but where illegitimate births are relatively numerous, data limited to legitimate births cannot be taken as representative. Similarly, for a few countries, the distribution of live births by age of mother is confined to infants born alive who did *not* die before registration of birth, whereas the totals in Table 8, as well as data for other countries in Table 10, include those who died before registration.

Table 11

Table 11 presents live-birth rates specific for age of mother for 57 areas for the years 1936-1953. Rates are derived from the corresponding live-birth statistics presented in Table 10, and from female population classified by age available at the census or in estimates.

Coverage

In relation to Table 10, the geographic coverage of this table is seriously limited by the non-availability of population data tabulated in corresponding age-sex categories. Live births tabulated by age of mother in accordance with

the recommendations of the United Nations[17] are available in Table 10 for 84 geographic areas, but the appropriate female populations by age are not available for all of these areas, nor for all years in the series, for most countries.

Another limiting factor is the omission from the rate table of any area for which the frequency in unknown age exceeded ten percent of the total live births. Still a third is the omission of series for which the total frequency is less than 50.

Rate computation

In computing age-specific rates, births to mother of unknown age have been distributed proportionately among births to mothers of known age.[18] Thus, except for the initial and terminal age groups, the rates are the number of live births to mothers in a specified age group (adjusted to include a proportion of the unknowns) per 1 000 women of that age group. Since only a negligible fraction of all births occur among women under 10 or over 50 years of age, births to mothers under 15 years of age and 45 years of age and over are related to female population aged 10 to 14 and to that 45 to 49 respectively. Population of unknown age does not enter the computation at any point because the birth rate for "all ages" is an age-limited one, based on births at all ages but computed on a female population aged 10 to 49 years only. For recent years, the populations used in the computation of the age-specific rates are those which appear in Table 3 or the corresponding table shown in previous issues of the *Yearbook*.

Limitations of the data

The rates shown in this table are subject to the same limitations as the corresponding frequencies in Table 10. Comparability is affected by the "completeness" of the base data, by the method of calculating age and by the differences in the basis of tabulation. The effect of the inclusion in the age-of-mother tabulations of delayed birth registrations may be seen in connexion with rates specific for age in Chile, Peru and Taiwan, for example, where the high rates at ages 45 and over may well be the result of recording the age of mother at the time of registration, rather than at the time of birth of child.

Table 12

For the first time in the *Demographic Yearbook,* data on legitimate live births by age of mother are presented in this issue for the years 1936-1953. Since this is a more complex tabulation than that shown in Table 10, the number of geographic areas for which data are available are fewer, numbering only 48.

Limitations of the data

The data in this table, being similar to those in Table 10, are subject to the same limitations described in relation to that table. Comparability is affected by completeness of registration, as symbolized in the code attached to Table 8; by differences in the basis of tabulation, indicated by the presence or absence of a dagger (†) following the country name in the stub of the table; by variations in the method of calculating age in completed years; and from basic errors in age reporting.

In one or two cases, data in Table 12 refer not to legitimate live births, but to legitimate live births and stillbirths. In other cases, they may exclude all live-born children dying before registration of birth; in still others they may relate to confinements resulting in legitimate live births and/or stillbirths. These variations should be kept in mind when data from this table are used.

Table 13

Birth rates specific for both age of mother and legitimacy are presented for the first time in the *Demographic Yearbook* in Table 13.

Coverage

Even more than Table 11, this table, though including rates for 24 areas, is seriously limited in geographic coverage by lack of an adequate population base. Not only must the appropriate population base be classified in age groups corresponding to the age distribution of the legitimate live births, but it must also be classified by marital status and sex. Such populations are usually available only at the time of a census of population, and hence the years for which both frequencies and population are available, in correct form, are few.

As in the total birth rates specific for age (Table 11), rates are not computed for a series in which the unknown age exceeds ten percent of the total legitimate births at all ages—nor are they computed for distributions the sum of which does not exceed 50.

Rate computation

In computing rates, births to mothers of unknown age, if less than 10 per cent of the total, have been distributed proportionately among births to mothers of known age. Rates are computed on married female populations aged 10 to 49 years, which are found in Table 4. Rates for specific age groups are the number of births to women in each age group (including a proportion of the "unknown age") per 1 000 married female population in the age group. For purposes of this table, "married" includes separated because there has been no loss of married status and excludes "consensually married," because that group of the population cannot contribute to legitimate births.

Corresponding to the method of computing total specific birth rates, the rate for ages "under 15" is computed on married female population aged 10 to 14, while the rate for 45 years and over is calculated on population 45 to 49 years of age. Population of unknown age does not enter the calculation.

Limitations of the data

Rates presented in Table 13 are subject to all the limitations inherent in the base data, such as lack of com-

[17] *Principles for a Vital Statistics System, Op. Cit.,* Principle 410e(5).

[18] This method of distributing the unknown ages is open to some criticism because of the fact that the age-of-mother distribution for legitimate births is known to differ from that for illegitimate births and that the proportion of "unknown ages" is higher among illegitimate births than it is among legitimate. A more accurate method of allocating the unknowns would be one which took cognizance of this fact, but the difficulty is that births by age of mother are not regularly tabulated also by legitimacy in every country.

pleteness, age reporting irregularities, and tabulation variations. However, it should be noted that these rates, being specific for age, sex and legitimacy, are more refined rates than those in Table 11 and, for this reason, are more comparable within and among themselves.

Table 14

Statistics of live births for 1936-1953, classified by age of father, are given in Table 14. This table, which appeared previously in the 1949-50 *Yearbook*, has been considerably expanded, although it still includes fewer series than the corresponding "age of mother" table. The age groups shown are under 20, five-year groups to 49, 50 years and over and unknown.

Coverage

Because of the nature of the data, statistics in this table are confined primarily to legitimate live births. When illegitimate births are included, they appear predominantly in the unknown age-of-father category.

Limitations of the data

The reliability and comparability of these data are governed by the same factors as are mentioned in connexion with age-of-mother distributions. Seven countries exclude from the series infants born alive who die before registration of birth or within 24 hours; several include stillbirths as well as live births. All are affected by variations in completeness; by age reporting errors; by variations in age calculation; and by differences in tabulation procedures.

Table 15

Birth rates specific for age of father, based on data presented in Table 14, are shown in Table 15.

Coverage

Because age specific rates require population by age and sex, this table, like number 11 and 13, is limited by nonavailability of the appropriate population base. Another limiting factor is the size of the frequencies in the age categories when the number of live births is distributed according to age of father. Rates are not usually calculated unless the total is at least 50. Thus rates are shown for only 29 geographic areas while Table 14 includes data for 58.

Rate computation

Rates in this table are computed by relating the live births classified by age of father to the male population classified in the same age groups. Births at unknown age have been distributed. The rate for all ages is based on all births but computed on male population age 15 to 64. The initial rate of "under 20" is based on births to fathers under 20 years of age related to the population age 15 to 19. Likewise the terminal rate relates births to fathers aged 50 and over to male population age 50 to 64.

Limitations of the data

In addition to all the limiting factors described in connexion with Table 14, one other is present in the series of birth rates specific for age of father. Because so many of the basic series relate to legitimate births only and because rates are computed on male population, rates for countries where illegitimate births are numerous are substantially lower than they should be. A more appropriate base for male age specific rates in such cases might be the married male population by age and sex but, as was pointed out in connexion with Table 13, this would reduce the coverage to perhaps ten countries.

Table 16

This table presents live births by live-birth order for each year 1936-1953. The table has been considerably enlarged since it was presented previously and now contains data for 61 geographic areas. Live-birth orders from the first to the ninth are shown separately; the tenth and higher are grouped together, and there is an unknown category.

Limitations of the data

As was the case in Tables 10, 12, and 14, comparability of these data is limited by differences in the treatment of illegitimate births, multiple births and stillbirths. The principal limiting factor, however, is the method used for establishing live-birth order.

The international recommendation included in the *Principles for a Vital Statistics System*[19] is that live births should be cross-classified by age of mother and live-birth order and that, for this purpose, live-birth order should be defined as "the numerical order of the child (the report of whose birth is being tabulated) in relation to all previous live-born issue of the mother, irrespective of whether pregnancies were nuptial or extra-nuptial." Many countries follow this recommendation, tabulating live births and basing their calculations on the number of previous live births, but others compute "birth order" on the "number of previous live births plus stillbirths"; still others use the number of confinements, including or excluding confinements resulting in stillbirths. In certain countries, parity is calculated on the basis of previous legitimate live births and/or stillbirths and, in some instances, on the basis of only those legitimate births that occurred during the existing marriage of the mother. Whenever such limiting factors are known, they are stated in the footnotes to the table.

In common with data in other birth tables, data by parity may be evaluated as to "completeness" by reference to the code which is part of Table 8. It should be noted, however, that unless the incompleteness of the data as a whole is very biased, the variation within one country may still yield useful information. Birth-order information is usually lacking for countries in which the lag between occurrence and registration is great. Therefore, the qualifications imposed by date-of-registration tabulation procedures can be ignored to a large extent.

Table 17

In Table 17, birth rates based on data in Table 16 are set forth. Data relate to live births, and birth order is based on the number of previous live births to the mother.

Coverage

Table 17 is less extensive in geographic coverage than Table 16 because of the need to establish correspondence between the numerator (births) and the denominator

[19] *Op. cit.* Principle 410e(5).

(population by age and sex) of the rates. In addition, rates for a number of areas are not computed because of the smallness of the frequencies when distributed into 10 or more classes. Nevertheless data for 37 areas are included.

Rate computation

Rates in this table are not specific for live-birth order because they are computed on female population 10 to 49 years of age, rather than on parity cohorts. Unknown birth order is not distributed, and rates are the number of live births in each birth order per 1 000 female population aged 10 to 49 years.

Since many of the series presented relate not to all live births but only to legitimate live births, it might have been desirable to compute rates for these on married female population of the selected age span. However, as noted in connexion with Table 13, the dependence on the more appropriate population base by age, sex and marital status would have restricted the coverage of the table markedly.

Limitations of the data

The same factors which make for lack of comparability of the frequencies by birth order in Table 16, affect the live-birth rates equally.

Some countries limit tabulations to legitimate live births; others, to confinements resulting in live births only, or in live births and stillbirths. As in the frequency table, however, the major limiting factor is the method of calculating birth order which was explained in connexion with Table 16.

Despite their limitations, data such as these permit study of certain aspects of fertility which are associated with differences in frequency of marriage or in size of family, such differences being reflected in the changing distribution of births among the various birth orders.

Table 18

Live births classified by age of mother and live-birth order are presented in Table 18 for 51 areas. These statistics, which are a cross-classification of the items found in Tables 10 and 16, are naturally less extensive in coverage than either of those tables.

As in Tables 10 and 16, age is classified into under 15, in 5-year groups to 44, 45 and over and unknown; live-birth order is in units to 9, followed by 10 and higher, and unknown. Therefore the marginal totals will correspond with the related tables unless otherwise qualified.

Limitations of the data

Being a combination of age of mother and live-birth order, these data are subject to all the qualifications set forth above in connexion with Tables 10 and 16. Comparability is limited by factors affecting age distributions (recording, reporting, calculating), those concerned with types of data (confinements, live births, stillbirths and pregnancies, legitimate and illegitimate) and those involved with the calculations of birth order. In addition, general comparability is affected by incompleteness of the data (evaluated in Table 8) and whether tabulations are by date of occurrence or date of registration.

In order to clarify the types of data involved and the methods of computing birth order, two types of notes have been used, one defining the data; the other, the method of calculating birth order in all its variations. In using data from the table, particular attention must be paid to the variations expressed in these notes.

Table 19

For the first time in the *Demographic Yearbook,* live-birth rates by birth order specific for age of mother are presented in Table 19 for 22 geographic areas, for each of the years 1948 and 1951. Coverage is limited by a number of factors chief of which is the availability of population classified by age and sex to correspond with a birth order-age distribution.

Although data for 1942-1953 were available for several areas, it was not feasible to publish rates for all possible years. Data for 1948 and 1951 were selected as most representative and far enough apart to reflect any significant changes.

Rate computation

Rates in this table are the number of live births in each birth order per 1 000 female population in specified age groups. Births to mothers of unknown age have been distributed proportionate to the known ages; unknown birth order was not distributed. Thus these rates are similar to those in Table 11 but, in addition, they are distributed according to birth order. As noted in connexion with Table 17, rates specific for birth order would be possible for only a very few countries which tabulate female population by age and number of children born. The available distributions of this type are given in Table 5. Even though calculated on total female population of each specified age group, the rates in Table 19 can throw considerable light on details of fertility characteristics and changes.

Limitations of the data

As noted in connexion with Table 18, data by age and live-birth order are subject to all the qualifications and limitations on comparability which come from age reporting, data completeness, variations in tabulation procedures and differing methods of calculating birth order. None of these should be overlooked in using data from Table 19.

Table 20

In relation to birth tabulations, duration of marriage has been defined in the United Nations *Principles for a Vital Statistics System*[20] as the number of completed years elapsed between the exact date of marriage and date of birth of child, and this definition has been adopted for Table 20.

The duration categories shown are: under 1 year, single years from 1 to 9, five-year groups from 10 to 19, 20 years and over, and duration unknown. The percentage distribution of births by duration of marriage is computed by relating the births reported in each duration, as well as the unknown, to the total number of births in that year.

[20] *Op. cit.,* Principle 309(10).

Coverage

It will be noted that the countries represented here are few in comparison with the number for which total birth statistics are presented in Table 8, an indication that for most areas of the world, tabulations by duration of marriage have not yet been developed. It will also be evident, however, that the geographic coverage of this table is more extensive than it was when presented previously in the 1949-50 *Yearbook* for 21 areas.

Limitations of the data

Like all other live-birth statistics, these are subject to all the qualifications of completeness, and tabulation procedures mentioned on page 18. In addition, lack of comparability may be introduced in the method of calculating duration. Although, according to United Nations recommendations, duration should be calculated in elapsed periods of time between exact dates (day, month and year), in reality it is often calculated as the difference between two years. This procedure introduces a generally upward bias in the numbers for all durations except "under 1 year," which is seriously understated, since births occurring within 12 months after marriage but not in the same calendar year are all included in the category, "1 year." The quantitative effect of this variation in method of determining "duration" may be seen in the statistics of the Netherlands for 1952. In that year "duration" was calculated by both methods, i.e., by date and by year alone, with the following results:

	Time between dates	*Time between years only*
Total	230 686	230 686
Under 1 year	32 084	10 775
1 year	27 359	35 606
2 year	22 938	24 555
3 years	21 091	21 463
4 years	20 492	20 681
5 years	20 161	20 570
6 years	16 326	19 542
7 years	8 486	12 170
8 years	7 769	7 291
9 years	53 980	8 167
10-14 years		32 993
15-19 years		13 011
20 years and over		3 724
Unknown		138

Another factor which must be borne in mind is the tendency, when reporting the "duration" item or the date of marriage upon which it is based, to limit reports to the last marriage, ignoring any previous marriage.

The necessary restriction of these data to legitimate births is a factor to be kept in mind. The presence in many countries of large numbers of consensual unions, which though resembling marriages are not officially recognized as such, means that correspondingly large numbers of births are classified as illegitimate and cannot be included in a distribution by duration of marriage. The resulting statistics are therefore an inadequate description of the true situation from the demographic, though perhaps not from the legal, point of view.

Table 21

Table 21 presents gross and net reproduction rates which have been provided by the statistical offices of the various countries or taken from official publications. In a few cases rates computed unofficially have been published with approval of the authorities concerned. Because the computation of reproduction rates is not in many countries considered a routine function of the statistical office, this table does not include all the countries for which rates could be calculated on the basis of available statistics.

The gross reproduction rate is the sum of female age-specific fertility rates. The rates are obtained by dividing the female live births in a year to women of given age by the female population of that age. They are then added together for all ages. The result is a rate "per woman," not " per 1 000 women" as in other rate tables in this volume.

The gross reproduction rate affords a method of summarizing, for comparative purposes, the age-specific fertility rates of women as recorded in different times and places. Unlike the crude birth rate the gross reproduction rate is not affected by the age distribution of the population.

In addition, the gross reproduction rate has often been interpreted as a measure of the average number of daughters produced by women during their lifetime. If a group of women born at the same time should experience at various ages the fertility rates on which a given gross reproduction rate is based, those who were still alive at the end of the reproductive age period would have borne on the average approximately the number of daughters indicated by the gross reproduction rate. However, this would be precisely true only if the women who died or emigrated before they reached the upper limit of the child-bearing period were not specially selected with regard to fertility.

According to another interpretation, the gross reproduction rate indicates the average number of daughters who would be born to a group of girls beginning life together, in a population where none died before the upper limit of child-bearing age (and where there was no migration) and where the given set of fertility rates was in operation. The gross reproduction rate thus shows the upper limit of the rate of population growth which would eventually occur if the fertility rates at a given time were maintained and the mortality of females under, say, fifty were reduced to zero. For example, in a population which permanently maintained fertility rates yielding a gross reproduction rate of 0.8, the number of births would in the end be reduced by 20 percent per "generation" even if no women died before living through the child-bearing period. A "generation" in the sense relevant here is roughly equal to the mean age of mothers at the birth of their daughters, in a stationary population subject to the fertility rates in question. It is usually about thirty years.

Net reproduction rates are obtained by multiplying the specific fertility rates of each group by the proportion of survivors to that age in a life table and adding up the products. The net reproduction rate may be interpreted, in analogy with the gross rate, as the average number of daughters that would be produced by women throughout their lifetime if they were exposed at each age to the

fertility and mortality rates on which the calculation is based. It also indicates the rate at which the number of births would eventually grow per "generation" if the fertility and mortailty rates on which the calculation is based should remain in operation indefinitely.

In using gross and net reproduction rates as means of analyzing the implications of observed fertility and mortality rates for future population development, it should be borne in mind that the age-specific fertility and mortality rates recorded in a given country at a given time do not actually represent the experience of any real generation of women, and that they may be influenced by factors which are, by their nature, necessarily temporary. Moreover, they do not take account of the fertility and mortality of the male population. Other indices which may come into wider use in the future as a result of recent discussions of the limitations of these rates—for example, measures of reproduction of the male population—have so far been computed for only very few areas and time periods. Increasing attention is being paid to the analysis of fertility trends on the basis of statistics of births classified by parity and by duration of marriage, such as are presented in Tables 16 to 20 in this volume.

The accuracy of gross reproduction rates obviously depends on the accuracy with which age-specific fertility rates can be computed. The principal sources of error are: (1) under-registration of births; (2) mis-statements or inadequate statements of the age of mother at registration; (3) errors in enumerations or estimates of the female population by age groups. These types of error are discussed in detail elsewhere in the text.

Reproduction rates are normally calculated from fertility rates relating to five-year age groups and to all births, both male and female. This differs somewhat from the procedure implied in the definition of reproduction rates as given above. However, the use of rates relating to single years of age and based only on female births leads to results which differ insignificantly from those given by the usual procedure.

Age-specific fertility rates calculated from data contained in the present *Yearbook* will be found in Table 11. Gross reproduction rates derived from the age-specific fertility rates given in this table may not be exactly the same as those found in Table 21, for the latter rates may have been based on different estimates of the female population or may have involved a different treatment of births for which the age of mother was not stated. There may also be special adjustments for the under-registration of births or other differences in method.

Some of the reproduction rates given in Table 21 are approximations, where data on total births were available, but not classified by age of mother. The method most widely employed in such cases is to use the age-specific fertility rates of other times or places to estimate the distribution of births by age of mother. This calculation usually gives a gross reproduction rate within 3 or 4 percent of the true value.

The accuracy of net reproduction rates is affected also by the accuracy of the life tables used. Some special questions arise in net reproduction rate computation in regard to the period of time to which the life tables relate. The life table used is frequently that computed from the death rates of women in the year to which the fertility rates relate, but often life tables for other years are used. Since the value of a net reproduction rate is likely to fluctuate far more as a result of changes in fertility rates than of mortality rates, the net reproduction rates so obtained are generally published under the dates to which the fertility rates relate. This procedure has been followed in Table 21. Wherever the life tables are known to relate to a different period from that of the fertility rates, the difference is indicated in the footnotes.

Stillbirth (late foetal death) statistics

Statistics of "stillbirths" are presented in Tables 22 to 27. Like statistics of live births and deaths, these series relate to the present-in-area population within the current boundaries of the geographic units specified.

Limitations of the data

Completeness of data. Stillbirth data more than any other are subject to severe limitations as regards completeness of coverage. Areas that are known to have generally deficient or irregular vital registration are indicated in Tables 8 and 28, but it should be understood that many countries with relatively adequate statistics of live births and deaths may have quite inadequate stillbirth statistics. It would appear that even with a highly efficient registration system, a considerably greater proportion of stillbirths than of live births or of deaths escapes registration. However, it is difficult to measure or estimate just what fraction of the total number occurring go unregistered. Consequently, no precise information on completeness of coverage similar to that which was devised for other tables could be developed and, hence, no quality code appears in this table. Perhaps the most that can be said, in general, is that the coverage of stillbirths in countries where most confinements are medically attended is more complete than in others.

Definitions. As noted previously, the comparability of stillbirth statistics is affected strongly not only by variations in completeness of coverage but also by differences in definition. A stillbirth is generally understood to be the birth of a viable foetus that is dead at birth, or, in other words, a foetal death occurring late enough in pregnancy for there to have been a fair chance of survival. As has already been indicated, certain countries classify live-born infants dying shortly after birth ("within 24 hours", "immediately", "before registration as a live birth", etc.) as stillbirths. The relatively few countries that are known to follow these practices are noted in the tables. Again, some countries do not consider viability but classify as stillbirths all foetuses which are reported to have been born dead.

Criteria of viability are usually based on the duration of pregnancy, measured in days, weeks, or months. The minimum period of gestation specified varies widely, ranging, according to available information, from 3 to 7 months. The interval most frequently specified as the minimum is 28 weeks. Some countries have an additional requirement that the foetus be a minimum length, the minimum specified ranging from 30 to 35 centimetres. In a number of cases, the only specification is simply that

the foetus must be viable or that it must be recognizable as a human being.

Although full information on how stillbirths are defined could not be obtained for all the areas and years for which stillbirth data are shown in this volume, some information on current practices is available for most of the areas and is summarized below. This classification refers to the "viability" criteria only, that is, to those which distinguish stillbirths from abortions. It does not take cognizance of the other criteria included in most stillbirth definitions, namely the "signs of life" which distinguish stillbirths from live births.

I. *Areas specifying a minimum period of gestation:*

A. At least 28 weeks

Bolivia
Brazil
British Guiana
British Honduras
Canada
Canal Zone
Ceylon
Chile, beginning 1944
Costa Rica
Denmark
Dominican Republic
Ecuador, beginning 1945
El Salvador (or 7 mos.)
Federation of Malaya
Gold Cost
Guatemala
Honduras (or 7 mos.)
Iceland (6½ calendar months)
India (some States)
Netherlands, beginning 1950[21]
New Zealand
Norway
Paraguay
Peru
Poland (7 months)
Romania (6½ months)
Thailand
Trinidad and Tobago
United Kingdom: England and Wales Scotland
Yugoslavia (or 7 months)

B. At least 26 weeks

Belgium (over 180 days)
Bulgaria (6 months)
Colombia (6 months)
Egypt (6 months)
Finland (6 months)
France (6 months)
Italy (6 months)
Liechtenstein (6 months)
Luxembourg (6 months)
Mauritius (6 months)
Netherlands, before 1950
Trieste (6 months)
Venezuela (6 months)

C. At least 20 weeks (or 5 months, as indicated)

Panama (5 months)
Philippines (5 months)
United States ("reached 20th week" for national compilations)

D. At least 3 months

Japan (over 3 months)

II. *Areas specifying a minimum length or weight:*

Austria (35 centimetres)
Czechoslovakia (over 400 grammes)
Germany: Federal Republic (35 centimetres)
Sweden (35 centimetres)
Switzerland (over 30 centimetres)

III. *Areas specifying that the foetus be viable or recognizable as a human being:*

Cuba (appearance)
Mexico (viable)
Portugal (appearance)
South-West Africa (viable)
Southern Rhodesia (appearance)
Union of South Africa (viable)

IV. *Areas without a definite criterion of viability:*

Angola
Cape Verde Islands
Channel Islands
Greece
India (some States)
Morocco (French)
Mozambique
Portuguese India
São Tomé and Principe
Spain
Zanzibar and Pemba

Where the period of gestation is expressed in months, it is sometimes intended that lunar months be understood, sometimes calendar months. It was not possible to determine for each case just which type of measure was used but, in the classification given above, it has been assumed that countries indicating 7 months refer to lunar months and, therefore, 28 weeks, while those indicating 6 months refer to calendar months, usually equated to 180 days or to 26 weeks.

Because of the heterogeneity in the definitions under which stillbirth statistics are compiled in different countries and the need for data on total foetal wastage which cannot be obtained under any of the current definitions of stillbirth, the Expert Committee of the World Health Organization took the matter under advisement at its second session in 1950 and made certain recommendations[22] for the consideration of the World Health Assembly. First among these was the proposal that "foetal death" should be defined rather than the term "stillbirth" and that the definition of foetal death should be the reverse of the definition of live birth. The foetal death definition, which was adopted by the World Health Assembly and later by the United Nations Economic and Social Council in the *Principles for a Vital Statistics System*,[23] reads as follows:

> Foetal death is death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the foetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.

The Committee made several other proposals which were not adopted by the Assembly but which were referred to the various countries for further study. Among these proposals were the following:

> .....
>
> (*b*) Tabulation of all foetal deaths is a desirable goal and should be attained as soon as possible.
>
> (c) As a minimum all countries should register and tabulate all foetal deaths occurring after the 28th completed week of gestation.
>
> (*d*) The following groups should be used in tabulations of foetal deaths:
>
> Less than 20 completed weeks of gestation .....Group I
> 20 completed weeks of gestation but less than 28 .....Group II
> 28 completed weeks of gestation and over .....Group III

[21] Data shown in this *Yearbook* are classified according to the definition in force before 1950: 26 weeks.

[22] World Health Organization. Expert Committee on Health Statistics. Report on the Second Session. *Technical Report Series No. 25.* Geneva, October 1950.

[23] *Op. cit.* Principle 202.

Gestation period not classifiable in groups I, II, and III.....Group IV

(The period of gestation is measured from the beginning of the last menstruation)

Foetal deaths, group I, may also be described as "early foetal deaths".

Foetal deaths, group II, may also be described as "intermediate foetal deaths".

Foetal deaths, group III, may also be described as "late foetal deaths".

...

(*g*) The term "stillbirth" when used in the statistics of any country should be synonymous with group III (late foetal deaths).

It was realized that the term "stillbirth" would of necessity continue to be used by many countries for some time.

...

Up to the present time, no country has reported statistics of all foetal deaths, although it is known that at least 14 countries have adopted the new definition—either wholly or with slight modifications. Until such time as data reported by countries reflect the new definition and include all foetal deaths, the *Demographic Yearbook* table will continue to appear as "late foetal deaths" or "stillbirths".

Tabulation by date of registration. These tables now include a symbol (†) to indicate those areas which tabulate stillbirths according to date of registration. In the case of stillbirths, this distinction is not necessarily important, inasmuch as stillbirths are usually registered soon after occurrence or not at all.

Table 22

Table 22 is a trend table which shows the number of stillbirths (late foetal deaths) in 140 geographic units for the period 1938-1953.

Limitations of the data

This table is subject to all the qualifications and limitations set forth above. Because it is not possible at present to evaluate the variations in completeness of stillbirth registration, the special notes hitherto shown have been deleted this year, and a more comprehensive general headnote is substituted.

Table 23

Stillbirth ratios based on the numbers presented in Table 22 are set forth in Table 23. This table shows annual ratios 1936 to 1953.

Computation of ratios

The ratios shown in the table are the numbers of stillbirths reported per 1 000 live births in the same period. This method of computation is adopted in view of the variability in the completeness of reporting of stillbirths and of the comparative stability of the reporting of live births from year to year. All ratios have been computed in the Statistical Office of the United Nations on live births shown in Table 8, except in the case of Ceylon where the live births recorded in the "Proclaimed Area" were not available for some years, although official stillbirth ratios were.

As a general rule, ratios are not computed for areas having frequencies less than 15 for any year, and those computed on frequencies between 15 and 50 are specially footnoted in the table with a double asterisk (**). This special note, indicating that one or more ratios in the series are computed on less than 50 stillbirths, is designed to alert the reader to the potential lack of reliability due to chance variation.

Limitations of the data

All the limitations described above are applicable to the stillbirth ratios, although it is sometimes difficult to identify incompleteness of stillbirth registration from ratios. Stillbirths are incompletely registered in most countries of the world. But when both stillbirths and live births are under-registered, the resulting ratios may be of reasonable magnitude. As a matter of fact, for the countries where live-birth registration is poorest, the ratios may be largest, so that the incompleteness of the base data is thereby hidden. This relative effect of live-birth registration completeness must be borne in mind in evaluating stillbirth ratios.

In addition to the indirect effect of under-registration of live births, stillbirth statistics may be seriously affected by differences in tabulation procedures. Stillbirth ratios, as noted above, are computed on live births, the incidence of which may be distorted by date-of-registration tabulation. When the annual number of live births registered and reported fluctuates over a wide range due to changes in legislation or to special needs for proof of birth on the part of large segments of the population, then the stillbirth ratios will fluctuate also, but inversely. Therefore, data for countries known to tabulate by date of registration should be used with caution unless it is also known that the tabulations of livebirths by date of registration approximate those by date of occurrence.

Table 24

Stillbirth statistics by age of mother are presented in Table 24. This table shows the distribution of stillbirths for 1936-1953 according to the following age groups: under 15 years of age, 5-year age groups to 44, 45 and over, and unknown.

Coverage

Fewer countries appear in this table than in the trend table because of the fact that fewer countries tabulate stillbirths by age of mother and because annual frequencies of less than 50 are usually not shown for a distribution with so many categories as this one has.

Limitations of the data

All of the data qualifications described on p. 27 above are applicable, i.e., limitations due to under-registration and lack of comparability in definitions. In addition, stillbirth statistics by age of mother are subject to the irregularities and inaccuracies of age reporting (see p. 12) and the differences in methods of establishing age, if derived from date of birth of mother.

Table 25

This table, which is the companion to Table 24, presents stillbirth ratios by age of mother for 44 areas, for the years 1936 to 1953.

Coverage

The geographic coverage of this table is limited by the factors affecting Table 24 and in addition by the size of the unknown age-of-mother group. If the unknowns are as much as 10 per cent of the total, the distribution is not used for ratios specific for age of mother because of the consequent deficiency in the individual age groups.

Computation of ratios

Ratios shown in Table 25 are the number of stillbirths in each age group per 1 000 live births in the same age group. Before computation, the live births to mothers of unknown age and the stillbirths in the same category are distributed proportionately throughout the known age groups except, as noted above, when the "unknowns" are as much as 10 per cent of the total, in which case the distribution is excluded from the table.

Limitations of the data

Data in Table 25 are subject to the same limitations as the frequencies in Table 24, and to the effect of date-of-registration tabulation of live births, as well. For a discussion of the effect of this factor, see p. 20.

Table 26

Cross-classification of stillbirths by age of mother and total-birth order are presented in Table 26 for 22 geographic areas. With one major exception, this table is similar to Table 18 which presented live births by age of mother and birth order. The exception is the type of birth order involved. Live births are shown by live-birth order, i.e., birth order calculated on the basis of all liveborn issue of the mother. In contrast, stillbirths are shown by total-birth order, that is, birth order based on total issue, liveborn or stillborn, during the life of the mother. This presentation is in accord with the recommendation of the United Nations in the *Principles for a Vital Statistics System.*[24]

Coverage

Because of the relative complexity of this tabulation and the unreliability of stillbirth data in general, the geographic coverage of this table is relatively small, comprising primarily European countries. Distributions based on total frequencies of small size, i.e., under 50, were excluded.

Limitations of the data

Lack of comparability among these data may be due to a variety of causes, including all the limitations of stillbirth statistics in general, age-distribution peculiarities, and, most important, variations in the type of data tabulated by these attributes and the method of calculating birth order. For a number of countries, data in this table relate to legitimate stillbirths, or to confinements. For some, birth order is based on legitimate births only. All of these variations are noted in the tables.

[24] *Op. cit.* Principle 410e(20).

Table 27

Ratios of stillbirths specific for age of mother and total-birth order are given in Table 27. These ratios are based on the stillbirth distributions in Table 26 and on the corresponding distributions of live births in Table 18.

Coverage

The construction of the ratios in this table presented a problem of selecting those stillbirth distributions which were tabulated by total-birth order and of locating corresponding live-birth statistics for the same year, tabulated in the same age-of-mother groups and according to the same type of birth order. The first point of correspondence to be established was type of data, i.e., stillbirths and live births; legitimate or total; or confinements in various combinations. Secondly, the method of ascertaining birth order was considered. In the absence of an obvious direct relationship, only one assumption was made in establishing correspondence. If the method of calculating birth order for the stillbirth distribution had not been ascertained, while it was known that for live births, birth order was "total," i.e., based on the number of live births and stillbirths borne by the mother, then it was assumed that stillbirth birth order was also "total-birth order." The application of these criteria resulted in the limitation of the table to 17 geographic areas for which ratios specific for age and birth order could be computed.

Computation of ratios

Stillbirths and live births borne by mothers whose age was unknown are distributed according to the proportions of known age. Ratios for unknown birth orders are not computed. Ratios are the number of stillbirths reported in specified age and birth-order groups per 1 000 live births in corresponding age/birth-order classes.

Limitations of the data

The limitations of ratios in this table, as in other stillbirth tables, are due to variations in completeness of registration, to differences of definitions, to basic problems of age reporting and classification, to differences in the types of statistics and in methods of calculating birth order. However, the latter qualifications are eliminated to some degree by the necessity of selecting for this table only those areas for which stillbirths and live births corresponded in terms of type of data and birth-order method.

Death statistics

Statistics of mortality are presented in Tables 28 to 31. These data, as in the case of births, do not represent a uniform degree of accuracy or completeness of registration.

The data presented relate to deaths which occurred within the present boundaries of the given country. Therefore, they may be presumed to include, unless otherwise specified, deaths among nomadic tribes and aborigines and those among national or alien armed forces, displaced persons, war refugees, and aliens residing in the country at the time when death occurred. They normally exclude deaths among armed forces and civilian nationals stationed or residing outside the country. It should be emphasized that the absence of qualifying notes

about inclusions or exclusions does not necessarily mean that the data conform to the standard definition. However, the information is given for virtually all cases where the difference involved is other than negligible.

Limitations of the data

The figures exclude stillbirths except in a few cases noted in the tables and in these the presumption seemed warranted that the number of stillbirths included was too small to invalidate the data. Deaths of infants who, though born alive, died before registration of birth or before 24 hours of age are excluded from the totals for certain countries because of the operation of the statistical definition of live birth and stillbirth discussed above. This exclusion is potentially an important one, inasmuch as deaths up to three days after birth, a period at which mortality tends to be high, may thus escape registration.

Because under-registration of deaths is more difficult to detect or measure than under-registration of births, the quality-of-data code columns in the tables presenting total mortality and infant mortality (Tables 28 and 31) contain more "unknowns" than does that in the table of birth statistics. It is generally believed that deaths are more completely registered than births, but this may not be the case everywhere. In fact, evidence is beginning to accumulate which suggests that, in some areas and under certain conditions, births may be more fully registered than deaths.

The tables have been carefully cross-checked and discrepancies in numbers or rates are in most cases explained in footnotes or otherwise accounted for. Differences which could not be explained are also indicated in footnotes, except where they are very small and involve only 1 or 2 deaths. Discrepancies in rates resulting from the use of population bases for different dates within the year (e.g., the midyear population in the crude rate table and the population at the census date in the age-specific rate table) are not noted. These differences are very small, seldom amounting to as much as one unit in the decimal place.

Table 28

This table presents the number of deaths which occurred each year 1946-1953 and crude death rates for 1920 to 1939 and 1946 to 1953, the period 1920 to 1939 being represented by five-year weighted averages, while for 1946 to 1953, annual rates have been computed. Unless otherwise indicated, the data refer to the deaths within the present geographic boundaries of the country and within the present-in-area population. However, it will be noted that this table, as well as Table 29, carries a number of footnotes specifying for war years the disposition of deaths among armed forces, both national and alien, and of civilian war casualties wherever such information is available and irrespective of whether the disposition constitutes a deviation from the present-in-area concept. This procedure has been followed because of the general uncertainty surrounding this problem and the advantages of specifying the disposition when it could be ascertained, inasmuch as inclusion or exclusion of deaths among armed forces may affect the crude death rate by as much as one point.

Coverage

There are 175 geographic areas shown in Table 28. This coverage excludes a few areas for which small (less than 15) frequencies were available. However, the geographic coverage implied by the 175 areas is somewhat more than is actually present because, in a number of cases, the statistics are confined to the non-indigenous segments of the population. As a consequence, the data for some regions, particularly for the continent of Africa, are of only minor significance.

Rate computation

Crude annual rates shown in this table are the number of deaths reported for a calendar year per 1 000 persons present in the same geographic area at the midpoint of the year or, in a few cases, at the census date or at some other point within the year. The rates for 1920-1939 are five-year weighted averages. In general, the population totals on which rates are computed are those presented in Table 2. Therefore, in the absence of an official population in Table 2, rates will not appear in this table despite the fact that frequencies for the year in question may be shown. Some exceptions occur when the rates refer to only a part of the population for which an estimate is published in Table 2, or when the years for which rates can be presented are solely those already covered in Table 1. But, in general, reference may be made to Tables 1 and 2 for information on the type of population which constitutes the denominator of the rates shown in Table 28. Wherever possible, rates which do not represent complete coverage either of geographic areas or of segments of population, or in which there is some lack of correspondence between the two components, are so noted. Rates are not shown where the coverage of the death statistics differs importantly from that of the available population base.

Limitations of the data

The quality-of-data evaluation code described previously will be found in this table, although it is equally applicable to Tables 29-31. The code which has been described on p. 18 should always be taken into consideration when data from this table are used for any purpose. Likewise, although the factor is of greatest importance in connexion with live births, attention is directed to the variation among countries in the basis of tabulation, i.e., by date of occurrence or date of registration, which is designated in this table by a symbol (†).

Table 29

Death rates specific for age and sex in 72 geographic areas, each year 1946-1953 are presented in Table 29. Except for initial age classes of "under 1 year" and "1-4", and a residual terminal group of "85 years and over", rates are specific for five-year age groups. Deviations from this classification are shown in the table.

Coverage

In general, the data relate to the present-in-area or *de facto* population of the geographic units cited. Wherever rates refer to the *de jure* populations involved, they are so noted.

Rate computation

In computing these age-specific rates, deaths at unknown ages and the population of unknown age were disregarded except as they formed part of the death rate for all ages combined. Each rate is, therefore, the number of deaths that occurred within a given age group during the course of a year per 1 000 persons falling within that age group at the middle of the year or at another date within the year. It should be noted that the rates for persons under 1 year of age in this table differ from the infant mortality rates shown in Table 31, the latter being computed on the number of live births reported for the year rather than on the population under 1 year of age at the middle of the year. Also, the rates for all ages combined differ in a number of cases from those shown in Table 28, the reason being that they are based on the total population for which an age distribution was available which could also be used for the computation of age-specific rates. This population might refer to a census date within the year rather than to the midpoint, or it might be more or less inclusive as regards ethnic groups, armed forces, and so forth. In a few instances, the difference is attributable to the fact that the rates in this table were computed on the mean population (obtained by averaging age data for two successive Decembers), whereas the corresponding rates in Table 28 were computed on an estimate for 1 July. Differences of these types are very small and are not noted in the table.

Limitations of the data

The problem of obtaining precise correspondence between deaths and population in the inclusion or exclusion of armed forces, refugees, displaced persons, and other special groups is particularly difficult where age-specific rates are concerned. In cases where it was not possible to achieve such a correspondence, the differences in coverage are noted. Male rates in the age range 20 to 40 years are affected by this non-correspondence and care should be exercised in using these rates for comparative purposes. It should be added that even when deaths and population do "correspond", the comparability of the rates may be affected by abnormal conditions such as absence from the area of large numbers of young men in the military forces. The result is that death rates appear high in these ages, simply because a large section of the able-bodied members of the age-group, whose death rates under normal conditions would be less than the average for persons of their age, have been removed from the computations.

Table 30

Cause-of-death statistics, both numbers and rates, are set forth in Table 30. This table shows data for at least one year for as many geographic units as possible. In some cases where nothing further was available, the data shown were previously published. But in most cases, the data are new and not previously published in the *Yearbook*.

Table 30 is divided into two parts, A and B. Part A shows deaths and death rates tabulated according to the "Abridged International List of Causes of Death" of the 1938 (fifth decennial) Revision of the "International List of Causes of Death",[25] while Part B is devoted to data tabulated according to the "Abbreviated List of 50 Causes for Tabulation of Mortality" of the 1948 (sixth) Revision, entitled "International Statistical Classification of Diseases, Injuries, and Causes of Death".[26] The two-part presentation is required because the 1948 Revision, unlike its predecessors, does not provide a classification scheme which conforms directly to the one immediately preceding it, namely to the 1938 Revision and, since the new scheme was recommended for adoption only in 1950, it is still too soon for every country to have introduced it into the coding, classifying, and tabulating of cause of death. The two parts supplement each other in that data for 1947, 1948, and/or 1949 are usually tabulated according to the 1938 Revision and appear in Part A, while data for 1951, 1952, or 1953 are usually classified according to the new Revision and appear in Part B. Nineteen geographic areas are represented only in Part A; four are in both A and B; none appears only in B.

Coverage

The criteria used to determine whether or not data for an area should be included in this table were first, availability of data classified according to either of the two "Lists" mentioned above, and second, that the total number of deaths classified as "due to senility" and "ill-defined or unknown cause" did not exceed twenty-five per cent of the total deaths from all causes. Even though the data by cause are known to be defective because of lack of medical certification, the areas are retained in the table unless they are eliminated on the basis of the above criteria.

Rate computation

Rates by cause of death are the number of deaths in each cause group per 100 000 persons in the midyear or other annual estimate of population. The rate for all causes combined is, therefore, the sum of the cause-specific rates, and it has a magnitude 100 times that of the crude death rate shown in Table 28 or the death rate at all ages shown in Table 29.

In one or two instances it may be noted that the rate for all causes does not agree exactly with the corresponding total death rate shown in Table 28. This lack of agreement is due primarily to differences in the total of deaths tabulated by cause which, in turn, might be the result of the omission of reports the receipt of which was delayed unduly, or the exclusion from the cause distribution of those infants born alive who died within 24 hours of birth or before registration of birth and who, therefore, were registered as "stillbirths" or as *"présentés sans vie"*. In several countries, tabulation procedures provide a method of distinguishing these pseudo-stillbirths from true stillbirths and of incorporating them into the total deaths, but there is no way of knowing the cause of the death, since it is not registered.

Limitations of the data

Cause-of-death statistics, which are of the greatest importance both from the public health and demographic point of view, are unfortunately subject to many defects

[25] *Nomenclatures Internationales des Causes de Décès 1938 (Classification Bertillon)*, published in co-operation with the Ministère des Affaires Etrangères de la République Français by the Institut International de Statistique, La Haye, 1940.

[26] *Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death*, Sixth Revision of the International Lists of Diseases and Causes of Death, Adopted 1948, Volume 1. (Bulletin of the World Health Organization, Supplement 1, Geneva, Switzerland, 1948).

in addition to those already described as limiting the international comparability of death statistics in general. These additional limitations arise mainly from differences among countries in the quality, availability, and efficiency of medical services and certification procedures. Particular care must be taken with respect to distributions with relatively large numbers of deaths attributed to "unknown", "ill-defined", or "unspecified causes" and to "senility". In such cases, causes of death among whole segments of the population may have been undiagnosed, and the distribution of known causes is likely to be quite unrepresentative of the situation as a whole. None of these unreliable distributions is specifically footnoted in the tables, but attention is called to the fact so that caution may be used in interpreting cause-of-death rates for areas in which a large proportion of the deaths are classified as "senility" or "unknown cause". An examination of the distributions from this point of view, together with the general quality code found in Table 28, should provide a basis for a rough evaluation of cause-of-death statistics. For a more detailed discussion of the problems involved in the interpretation of cause-of-death statistics, see Chapter II of the *Demographic Yearbook 1951*.

Table 31

Statistics of infant mortality (mortality under 1 year of age) are given in Table 31 for the period 1920 to 1953. Like Table 28, this table presents 5-year weighted average rates for 1920-1939, annual infant mortality rates for 1946-1953, and the number of deaths under 1 year for 1946-1953.

Coverage

These data relate to the present-in-area population of the 158 major geographic units for which recent statistics on infant deaths were reported. Since infant mortality rates are computed on the number of live births, the availability of population bases is not a limiting factor in the coverage of this table.

Rate computation

Computed in accordance with the conventional method, infant mortality rates shown in this table are the number of deaths under 1 year of age per 1 000 live births which occurred during the same time period. This means that no adjustment was made to take account of the fact that some of the infant deaths which occur during a given year are deaths of infants who were born during the preceding year. However, unless the numbers of live births or infant deaths are changing rapidly, the error involved is not important.[27]

Limitations of the data

Perhaps the most important and widespread limitation on the comparability of infant mortality rates is that resulting from compiling statistics of infant deaths and live births by date of registration, irrespective of the date of occurrence of the events. Where these procedures obtain, a large increase, for whatever reason, in the number of live births registered in any one year may introduce sizable errors into the infant mortality rates, especially since deaths tend to be more promptly reported than births. If the delay in registration remains nearly constant and is approximately the same for births and deaths, the rates are not affected to any appreciable degree by this factor. But if—as is the case in many countries—a large proportion of the births for one reason or another are not registered until many years after occurrence, then infant mortality rates obtained by relating infant deaths for any one year to births which occurred over a period of years, have little validity. Because of the importance of this factor, especially as it relates to the live births which constitute the denominator of the infant mortality rates, the statistics known to be by year of registration are identified with a dagger (†).

Even on a "date-of-occurrence" basis, under-registration of births and infant deaths also affects the rates unless the proportion registered is the same for both components. In order that information on the completeness of the data may be available, the code "C" or "U", discussed in detail on p. 18 has been incorporated into this table as a guide. This code, which is essentially that shown in connexion with deaths at all ages in Table 28, refers primarily to the completeness with which deaths under one year are registered and reported. Differences in completeness between the two components of the infant mortality rate, i.e., infant deaths and live births, will bias the rates upward or downward, the direction of bias depending on which component is more fully registered.

Another factor which has a bearing on the completeness of live-birth and infant-death registration is that concerned with the statistical definitions of the events to be reported. As indicated in the discussion on p. 17, the exclusion from both the live-birth and the death register of live-born infants who die before 24 hours of age or before registration of birth, may distort the statistics to some extent, tending to give the rates a downward bias. Failure to register as a live birth each infant death which occurs during the first few weeks of life may also be a factor in the lack of comparability among infant mortality rates, but the effect, if any, would be toward an upward bias.

Marriage statistics

Statistics of marriages are given in Tables 32 and 33. In accordance with the recommendation made in the *Principles for a Vital Statistics System*,[28] the statistics refer, unless otherwise noted, to formal marriages, that is, to the legal union of persons of opposite sex, the legality of which may be established by civil, religious, or other means recognized by the laws of each country. Wherever possible, the data presented in the tables relate to both civil and religious marriages (if both types of marriage are recognized) and are the number of marriages performed during the specified year, rather than the number registered.

Data presented in these two tables relate to marriages performed within the present boundaries of the geographic areas indicated and, unless otherwise noted, within the present-in area population of those areas. However, by virtue of the legal concept to which the data are bound, marriages among tribal or indigenous groups

[27] For a more detailed discussion of this problem, see *Foetal, Infant and Early Childhood Mortality*, United Nations. Department of Social Affairs. Population Division, document ST/SOA/Series A, Population Studies No. 13, New York, Vol. I, Chapter II.

[28] *Op. cit.* Principle 202.

isolated from the dominant culture are almost invariably excluded from the statistics. These cases are generally footnoted, nevertheless, as well as all other deviations from the *de facto* concept.

Limitations of the data

Because marriage, unlike birth or death, is a legal act rather than a biological fact, the problem of comparability takes on a somewhat different aspect in relation to these data.

Definitions: With respect to the effect of variation in the statistical definition of marriage, for example, it should be noted that by their nature, consensual unions are excluded from the usual definition and, thus, from statistics of marriages, except as special measures for legalizing them may bring them into the category of legal marriages. In some countries, such unions are as frequent as formal marriages and are accepted as marriages in the local *mores*. Marriage statistics for these countries are misleading therefore as to the actual rate of family formation.

The need for obtaining statistics on consensual unions was recognized by the Statistical Commission in the *Principles for a Vital Statistics System*[29] where it said, in reference to the Definition of a Vital Statistics System (Principle 101). ". . . Particular attention is drawn to the desirability of exploring methods for obtaining data on non-registered marital unions (variously known as 'common-law', 'customary' or 'consensual') with recognition of the fact that, by their very characteristics, they are not obtained by the registration method as defined in Principle 102."

Until such times as a means of recording these "non-registered marital unions" is developed, statistics of marriages will refer to formal or legal unions only and, as such, will be misleading as indices of biological unions, a knowledge of which is important both from a demographic and a public-health point of view.

The composition of the statistics within the framework of each country's legal definition of marriage varies considerably, depending on laws and practices with respect to the registration of marriages and the compilation of statistics. Thus, some countries compile statistics only for civil marriages, although religious marriages may also be legally recognized; in other countries, the only records available are church registers and the statistics, therefore, relate to religious marriages only. In one or two countries, statistics relate to the marriage licenses issued, that is, to the documents granted by the State, certifying to the fact that the requirements for legal marriage, i.e., requirements of age, consent, health, and so forth have been met. The number of marriage licenses issued necessarily overstates the number of marriages performed, since such licenses are declarations of intent not followed in all cases by a marriage ceremony. In the absence of statistics of marriages performed, however, they do give a fair approximation to the actual number of marriages which occurred.

Completeness of data: Because of the variation in the content of marriage statistics in each country (i.e., civil and/or religious), it is rather difficult to evaluate "completeness" in a relative sense and in terms of including every event which occurred. Moreover, the concept of "completeness" is actually difficult to define in the case of marriages because, in most countries of the world, the act of legalizing the union is at the same time the legal "registration" of the union. However, in countries such as the United States and in those where only religious marriages are legal, the act of registering the marriage in the civil register is a separate and distinct function from the performance of the marriage ceremony and, in such cases, there may be a discrepancy between the number of legal marriages actually performed and the number which are registered. In view of these considerations, the measures of "completeness", provided by the countries, have been shown in Table 32 in the form of the code "C" or "U" to denote "complete" or "incomplete" statistics of marriages, however defined.

The existence or non-existence of a time interval between the performance of a marriage and its registration is pertinent also to the understanding of the implications of the symbol (†) used in Table 33 as it is in other tables to indicate that statistics were tabulated on a date-of-registration basis rather than by date of occurrence. As was pointed out previously, the qualification is most meaningful in relation to live births; nonetheless, together with information on the type of data included in the statistics, it may need to be kept in mind in referring to marriage statistics from Tables 32 and 33.

Table 32

This table, corresponding in format to Tables 28 and 31, presents the number of marriages performed in 1946-1953, together with the crude marriage rates for the period 1920 to 1939 and 1946 to 1953. Rates for 1920 to 1939 are five-year weighted averages, while those for 1946-1953 are based on annual data.

Coverage

Statistics are presented for 150 individual geographic areas which, because of the lack of a corresponding population base, may be somewhat less than the coverage of a table devoted solely to the "number of marriages." As in similar tables on live births and deaths, some geographic areas are omitted in the absence of recent data. It should also be noted that the geographic coverage, extensive as it appears, is still somewhat deficient for much of Africa where data relate to small segments of the total population only.

Rate computation

The rates in Table 32, like corresponding crude rates in other tables, are the number of marriages reported as having occurred within the boundaries of the geographic area per 1 000 total persons present in the same area at the midpoint of the year in question. In only a few cases is an estimate for some other date within the year, or a census figure, used in place of the midyear population. The populations, midyear or other, used in the computation of the rates are, in general, the official figures presented in Tables 1 and 2. Therefore, in the absence of an official population for any year, a rate will not be computed, despite the fact that the frequencies are available. Rates may be shown for areas for which population

[29] *Op. cit.*

does not appear in Table 2 if the data refer to only a part of the population or when the years for which rates can be presented are solely those already covered in Table 1. But, in general, reference should be made to Table 2 for the type and coverage of the populations used in computing the rates shown in Table 32.

Limitations of the data

As explained above, this table, like all corresponding trend tables, includes in addition to numbers and rates, a quality-of-data code which appears as "C" or "U" in the first column of the table. The elements of the code and its implications have been described on p. 18 and above.

The lack of comparability resulting from varying definitions of what constitutes a "marriage" and the differences among countries in the proportion of total unions which are "consensual", i.e., non-registered unions, will be evident from an examination of the crude rates shown in Table 32. The very low rates shown for some countries, particularly in Latin America, are largely attributable to the prevalence of consensual marriage, though under-registration of legal marriages is in some cases a contributing factor.

Crude marriage rates, like crude birth and death rates, are of only limited value for analytical purposes. Marriages are more appropriately related to the "marriageable" population, i.e., widowed and divorced persons and single persons who have reached the age of consent. However, crude rates do measure changes and differences in the frequency of marriage in a total population, and fluctuations in the rate are often found to reflect changes in economic and social conditions.

Table 33

Marriage rates specific for age and sex are presented in Table 33. Rates for 39 geographic areas are included in the table, and the time period covered is 1936-1953. The table shows an initial rate of "under 20 years", rates for five-year age groups from 20 to 64, and a terminal rate of "65 and over".

Coverage

This table, like its age-specific counterparts in live births and deaths, is seriously limited in coverage by the lack of populations appropriate for the computation of age-sex specific marriage rates. Such rates require statistics of population classified by age, sex, and marital status—distributions which are usually available only as the results of a census of population. In accordance with the vital statistics Principle 410e (23),[30] statistics of marriages by age of participants have been compiled for 66 geographic units in addition to the 39 shown in Table 33 but, either because the frequencies were too small or because a corresponding population was not available, rates could not be computed.

Rate computation

Rates in this table are the number of brides or grooms in each age group per 1 000 marriageable population of the same age and sex. For purposes of this table, "marriageable" population comprises the population single, widowed, divorced, "consensually married", or of unknown marital status which is 15 years of age or over and of "age unknown".

Since, in the countries shown, only a negligible fraction of marriages occur at ages less than 15, the rate for the initial age group is based on marriages under 20 years of age but computed on marriageable population 15-19 years. The rate for the terminal age group of 65 and over is based on marriages at those ages and computed on a corresponding population. The "total" rate, however, is based on marriages at all ages (including unknown) and is computed on a population which also includes that of unknown age. But because this total rate is age-and-marital-status-limited, it will never agree with the total marriage rate shown in Table 32. In fact, if data from Table 32 are compared with those shown in this table, it will be seen that in some cases, crude rates indicate a downward trend where the specific rates indicate an upward trend. This fact also serves to emphasize the limitations of crude rates as indicators of nuptiality trends.

Limitations of the data

One of the principal limitations of data shown in this table is that they are available only for relatively few areas and for widely separated years, due to the fact that the required population bases are usually not available except as a result of a census. It is not always possible, therefore, to compute rates for current years, yet dependence on data relating to a year long past may be completely misleading, especially when the incidence of marriages is changing rapidly—as, for example, with the advent of war.

The next most important limiting factor to be considered in connexion with Table 33 is that of definition, both with reference to "marriages" themselves and also in relation to the "marriageable population" used in rate computation. Differences between the reported marriages, e.g., civil or religious or both, and between the populations with respect to disposition of that segment which is in a consensually-married status, should always be borne in mind in using data from this table. Moreover, the population by age, sex, and marital status used as a base for the rates is also subject to all the limitations which affect age distributions of population in general. These are discussed on p. 12.

Limitations implied by the code of completeness attached to Table 32 but applicable as well to this table, warrant some consideration although, as explained in connexion with Table 32, the meaning of the codes in connexion with marriage registration is not always important. The limitations imposed by date-of-registration tabulation procedures can be largely ignored in evaluating data from Table 33.

Divorce statistics

Tables 34 and 35 present statistics of divorce. The data which appear in these two tables refer, unless otherwise noted, to final divorce decrees reported by each country, the definition of a divorce used here being that recommended by the United Nations in *Principles for a Vital Statistics System*,[31] which is as follows:

[30] *Principles for a Vital Statistics System, op. cit.*

[31] *Op. cit.* Principle 202.

Divorce is a final legal dissolution of a marriage, that is, the separation of husband and wife by a judicial decree which confers on the parties the right to civil and/or religious remarriage, according to the laws of each country.

The definition automatically restricts data in Tables 34 and 35 to "final decrees of divorce" and excludes "legal separations" and "annulments". Moreover, the final decrees reported may be granted by religious or civil courts according to the law in each country; they may be registered either by the courts alone or by the courts and the civil registrar; and statistics may be based on court records or on statistical reports of divorce. These factors have no real bearing on the nature of the data, although the type and character of the divorce data are noted in the tables when specified in the source.

In so far as possible, divorce statistics refer to final divorce decrees registered during a specified time period in the present-in-area population of the geographic unit specified. Like marriages, divorces among tribal or indigenous groups isolated from the dominant culture are invariably excluded from the data.

Limitations of the data

Divorce data are affected by the same kinds of legalistic considerations as those described above in relation to the marriage data. They are perhaps affected by even wider variations among countries in the laws and regulations relating to the dissolution of marriage. These laws range from total prohibition in Brazil, Chile, Colombia, Ireland, Italy, and Spain, among others, through the wide range of grounds upon which divorces may be granted, to the ready granting of divorce in response to a simple statement of desire or intention. Naturally, the incidence is relatively lower in areas where divorces are difficult to obtain, though variations in social *mores* are also a contributing factor to variations in the frequency of divorce. These two factors are not unrelated.

Because of the differences cited above, divorce rates cannot be taken as indicative of the actual rate of marital dissolution from the social and demographic point of view, for many marriages are broken in other ways than through divorce (as through death, desertion, etc.). Divorce rates are likely to measure how well the population can afford divorce or the stringency of divorce laws rather than how often family or marital dissolution actually occurs.

For countries where polygamic marriage is an accepted institution, divorce statistics have a somewhat different meaning. In these areas, the factor of freedom to marry a different spouse is relatively unimportant, at least for males, and divorce is more frequent than in other areas. Egypt, for example, recognizes three types of divorce (revocable divorces, suspended marriages, and final divorces), all of which are concerned with the conditions under which the marriage in question may be resumed rather than whether other marriages may be contracted. They are also concerned with economic and financial obligations, but this is an element of divorce regulations in other countries as well.

Definitions. It will be noted from the tables that a number of countries include "annulments" with statistics of divorce. An annulment according to the vital statistics Principles[32] is the "invalidation or voiding of a marriage by a competent authority, according to the laws of each country, which confers on the parties the status of never having been married to each other". Thus, an annulment differs from a divorce in that the preceding marriage is cancelled rather than set aside or dissolved, although it is similar in that it confers on the parties the right to remarry. In countries where divorce, as defined above, is recognized, the number of annulments is usually quite small. It should be noted, however, that in countries where divorce is prohibited, the act of marriage annulment may tend to take the place of the legal divorce decree as a means of accomplishing dissolution of marriage.

Another factor which may influence comparability between series of divorce data is the inclusion, in a few cases, of legal separations. Normally, a "legal separation is the disunion of married persons, according to the laws of each country, which does not confer on the parties the right to remarry."[32] In some areas, Sweden for example, legal separation is typically a preparatory phase to divorce, divorce being granted automatically after a stated period of legal separation.

Finally, in respect of definition of data included, it may be noted that some countries report "petitions" rather than final decrees. These two terms have for each other somewhat the same relationship as the concept of "licenses" has to "marriages", but in the case of divorce, it may perhaps be said that the number of petitions entered in the courts constitutes an adequate approximation to the number of divorces granted, although every petition does not result in a final decree. The important limitation in using statistics of "petitions" rather than of "divorces granted" lies in the time reference of the data. In such cases, data such as "age of divorcees", "age of dependent children", and so forth, refer to the time of the petition rather than to the date of the decree, and this may involve an error of several years.

Completeness of Data. The evaluation of "completeness" is even more difficult in respect to divorces than it is for marriages, inasmuch as the granting of divorce as defined here is a legal act which by its nature is registered. Statistics of divorce are based on registered events reported by the religious or judicial courts directly, or by the courts to statistical authorities. In either case, it is conceivable that some registered divorces fail to be reported statistically, especially those originating in religious courts, and it is in this context that the codes of completeness which will be found in Table 34 must be viewed. The elements of the code have been set forth on p. 18.

As in the case of marriages, tabulation by date of registration rather than by date of occurrence does not impose any sizable limitation on the comparability of the data. There may be a slight time lag between the granting of the decree and the registration of that decree in the civil register, but the delay in any case probably should not exceed a reporting period, normally a month or a quarter. Because of the lack of homogeneity in the data, the symbol distinguishing the basis of tabulation is omitted from the divorce table.

[32] *Principles for a Vital Statistics System, op. cit.* Principle 202.

Table 34

Table 34 presents the number of final divorce decrees together with the crude annual divorce rates for 1946-1953.

Coverage

Unless otherwise noted, statistics in this table relate to the present-in-area population of 104 geographic areas. This coverage, while relatively extensive for divorce statistics, is still somewhat below the potential coverage due to several factors. As in similar time-trend tables presented in this *Yearbook,* the geographic coverage of this table was limited by the availability of population totals on which to compute rates for 1946-1953 and also by the fact that for some areas, the incidence of divorce was too small to provide an adequate base for a rate. In this table, as in similar tables of live births, deaths, and marriages, the coverage for Africa is extremely limited.

Rate computation

Crude divorce rates are the number of final divorce decrees reported in the time period per 1 000 persons in the midyear or other annual estimate of population. In general, the populations on which the crude rates are computed are those official estimates or censuses presented in Tables 1 and 2. Reference to these two tables will provide information on the character of the denominator of the crude rates in respect of its type and coverage and also as to its revised or unrevised nature. As noted previously, lack of an official population base has limited the years for which rates could be shown in the table, even though the frequencies for the year in question are available.

Limitations of the data

In the first column of Table 34 will be found the quality-of-data code referred to above. The limitations imposed by the code are limitations of data completeness, applicable as well to Table 35, which shows divorce rates specific for marital status.

The total number of divorces and the crude divorce rates are subject to all the other limitations mentioned in connexion with divorce statistics, including differences in the regulations governing the divorce procedure and variations in the type of data to which statistics of divorce relate. In addition, crude divorce rates computed in relation to all persons in the total population are subject to the limitations of crude rates in general. Crude divorce rates are a measure of the frequency of marriage dissolution by divorce or of the gross additions to the marriageable population. But because of basic differences in the marital status and age composition of populations, they do not measure the risk of divorce among married persons or couples. They give only a general idea of the trends over time and the gross differences between countries in levels of divorce in the total population, limited always by the international variations in the meaning of the term "divorce".

Table 35

Because crude divorce rates tend to be misleading as to the relative frequency of divorce among persons married and, therefore, able to be divorced, a more refined divorce rate computed on a population composed of married couples is presented in Table 35. These refined rates, which are 3-year annual averages, are shown for the present-in-area population of 53 geographic areas for selected years during the period 1935-1953.

Coverage

These rates require statistics of population classified by marital status and, in addition, divorce statistics for three years centred on the year to which the population data refer. Since, with a few exceptions such as Sweden, the Netherlands, and England and Wales, population by marital status is regularly available only at the time of a population census, the geographic coverage of Table 35 is severely limited. Divorce statistics (totals) are actually available for a total of 104 geographic areas, but dependence on population by marital status decreases the geographic coverage of Table 35 to 53 areas.

Rate computation

Rates shown in this table are the annual average number of final divorce decrees in a three-year period per 1 000 married couples as of the midyear of the period. The selection of the 3 years to be averaged depends on the identity of the year for which population by marital status is available, which might be either a census year or a year when an estimate by marital status was made. The number of married couples in the population was determined by averaging the number of males and females reported "married" and "separated" at the time of the census, or, for a non-census year, the number estimated as being in the married category. "Married" in the sense used here means formally married, that is, it does not include persons in consensual unions who are considered as part of the "marriageable" population. Persons in the "legally separated" category were included as "married", inasmuch as their marriages have not yet been dissolved. Wherever data for a country diverged from these basic concepts, they are footnoted in the table.

Limitations of the data

In addition to all the limitations imposed on divorce statistics by virtue of the nature of the basic data, evaluation of divorce rates specific for marital status must include a consideration of the method of constructing the population on which rates are based, especially in respect of the disposition of persons in consensual unions and those legally separated. In several areas for which rates are shown in Table 35, persons in consensual unions were included with "married population", thus giving a downward bias to the divorce rates. In others, the legally separated were excluded from the married population, which results in an upward bias. Such divergencies are rare, however, and the important limitations are those discussed in relation to divorce statistics as such. In evaluating the effect of these limitations—such as the inclusion of annulments or legal separations, substitution of "petitions" for "final decrees", and the wide variation in the latitude of the regulations governing divorce in the different countries — it should be borne in mind that specific divorce rates computed in relation to the population at risk, namely that in the married state, are the most reliable indices of the relative frequency of divorce. Though the general increase in the incidence of divorce

is significant and persistent enough to transcend the effects of using the total population rather than the specific population for the computation of rates, the implied rates of change as evidenced by the specific rates are quite different.

LIFE TABLES

Tables 36, 37, and 38 present official life-table values not previously published in the *Demographic Yearbook* for the period 1900-1953. It thus supplements the corresponding tables shown in the 1953 *Yearbook,* which included functions from all life tables available at that time.

Three functions are given: in Table 36, the probability of dying within one year or within a specified age interval for persons of exact ages specified (q_x); in Table 37, the survivors at the beginning of each age interval out of a generation of 100 000 (l_x), and in Table 38, the mean after-life or the mean expectation of life for persons at exact ages specified (e_x). In the three tables, data are given for each year of age under 5 and for each fifth year thereafter to 85.

Life tables are based on observed mortality conditions for a selected period, but permit a more detailed analysis of the implications and prospects inherent in those conditions than do conventional central death rates such as those shown in Table 29.

Though first developed for actuarial purposes, the life table has many applications in the demographic field. Among these are: (1) the preparation of population projections by age and sex; (2) analysis of effects of mortality on the age and sex composition of a population; (3) comparisons of summarizing measures of mortality, as the life table death rate (the reciprocal of the expectation of life at birth), expectation of life at various ages, etc.; (4) computation of net reproduction rates; and (5) the appraisal of the accuracy of census enumerations and vital registration data. In addition, life-table techniques have been applied to the analysis of other types of demographic data, for example, in the computation of probabilities of marriage, specific for age and sex, on the basis of census data classified by marital status.

Coverage

Data for various periods are shown for 18 geographic areas in Table 36, for 20 in Table 37 and for 21 in Table 38. Data cannot be presented for many areas of the world because of the lack of reliable information on population and deaths referring to the entire populations.

Evaluation of quality of data

The accuracy of life tables depends mainly upon the accuracy and completeness of the registration of deaths and of the enumeration of the population at the census. Deficiencies in death registration are likely to be greater than in census enumeration. Where this happens, death rates are understated and the l_x and e_x values are exaggerated. The mortality rates computed from population and death statistics at the very young ages are particularly likely to be understated, and such an error affects the l_x values throughout the table. As indicated earlier, infant mortality rates obtained by relating the number of infant deaths to the number of births in countries where registration is deficient may be either too low or too high, and the error in either direction may have an important effect on the l_x values for every age. The expectation of life at birth (e_x) will also be too high or too low.

The accuracy and the international comparability of life-table values are particularly suspect at the highest ages. Those values depend, as has been said, on imperfect data and frequently on somewhat arbitrary procedures. Certain remarkable features—for example, the fact that the expectation of life at ages over sixty is often distinctly higher in countries where mortality in general is heavy than in countries with low death rates—may, thus, merely reflect imperfections of the tables.

Differences in the methods used for constructing life tables (adjustment of data, graduation, etc.) may affect the reliability of the results and impair their international comparability. The effect of such differences is, however, probably much smaller than that of deficiencies in censuses and in death registration.

Table 36

This table presents life-table mortality rates for 18 geographic areas. The life-table mortality rate represents the probability of dying during a given age interval, usually one year. It is the basic function of the life table and is commonly indicated by the symbol q_x, the subscript referring to the age and values for specific ages being writeen q_0 for "under 1", q_1 for age 1, etc. The values shown in the table are expressed as *1 000* q_x and represent the number dying per 1 000 persons reaching age x or the probability per 1 000 of dying within one year or within the specified age interval after reaching age x.

The life-table mortality rate differs from the central death rate in that it refers to persons reaching the given age during the course of a year rather than to persons of that age at the middle of the year. Thus, the rates are similar in concept to the infant mortality rates shown in Table 31. But the life-table mortality rate for persons under 1 year of age usually differs from the type of infant mortality rate shown in Table 31 through being so adjusted that infant deaths are related to the cohort of births among which they occurred.

The complete life table gives values for each single year of age. An abridged life table gives values for grouped ages, usually 5-year age groups. Some of the data in the table are of the latter type and are so indicated. In these cases, the mortality rate is the probability of dying, not within one year after reaching the age indicated, but within 5 years of that age (or within the specified number of years).

Details of procedure in life table construction vary somewhat, depending in large measure upon the availability and form of basic data. The values of q_x are generally so derived as to correspond to the death rates of persons of that age in a particular period of time. The basic data ordinarily consists of (*a*) deaths in a given period classified by age and sex and (*b*) the mean population of each age and sex during that period. The most usual procedure is to utilize statistics of deaths in a three-year or five-year period centred at the census date so that the census figures can be taken as the mean population. Sometimes the period covered is that between two censuses, and the population figures utilized are averages of the results of the two

censuses. A correction for the effect of migration is occasionally made. In a few rare cases (for example, in India), approximate life tables have been computed without the use of data on deaths by deriving q_x values from the comparison of the population in each age group as enumerated at one census with the survivors at the next census. It is common to make adjustments in order to correct for misstatements of age in the census and death-registration data and in order to obtain successive values of q_x which vary smoothly from one age to the next.

Special problems arise in deriving q_x values for the very young ages and for the end of life. For the young ages, q_x values are frequently obtained by using the statistics of births occurring in the last few years and estimating from them the number of persons at risk of dying in the period to which the life table relates. At the older ages, data are frequently so scanty or unreliable that they have to be subjected to considerable manipulation if a reasonable series of q_x values is to be derived from them. In many cases, the life-table q_x values at the high ages do not depend in any way on the registered deaths at those ages, but have been estimated on the basis of q_x figures for younger ages.

Table 37

Life-table survival (l_x) values are presented in Table 37. These figures were derived from the q_x values and represent the number surviving to each age among 100 000 (10 000 or 1 000) born alive and subjected thereafter to the mortality rates of the given life table. In other words, they are the probability, per 100 000 (10 000 or 1 000), of surviving from birth to the exact age specified.

Table 38

Table 38 gives the "expectation of life" (e_x) or the average number of years of life remaining for persons reaching the specified ages. These data are also based on the mortality rates of the life table and are to be interpreted strictly in terms of the underlying assumption that surviving cohorts are subjected to the age-specific mortality rates of the period to which the life table refers. Thus, in interpreting e_{50} in the 1945-1948 life table for Norway, it may be said that, if males reaching age 50 were to experience for the rest of their lives the same age-specific mortality rates that obtained during the period 1945-1948, they would, on the average, live 26.4 years past the age of 50.

INTERNATIONAL POPULATION MOVEMENTS

Tables 39 to 43 on international population movements contain statistics of international travellers classified in major categories of departures and arrivals, and statistics on two of these major categories, those of permanent emigrants or immigrants, classified by country of last, or intended, permanent residence and by sex and age. The data relating to permanent migrants, being in general the most useful for demographic research, are much more detailed than those on international travellers.

This selection conforms to the United Nations *Recommendations for the Improvement of International Migration Statistics.*[33] The *Recommendations* were adopted by the Population and Statistical Commissions of the Economic and Social Council after detailed consultations with governments and interested international agencies; they were endorsed by the Council in Resolution 469.E(XV) of 27 April 1953.

In the *Recommendations,* equal importance is given to the publication by every country of certain other classifications of permanent migrants than those mentioned above, namely the tabulation by country of birth or citizenship and, for migrants of working age, the tabulation by usual occupation for each sex separately. It was however not possible to include such tables in this issue of the *Demographic Yearbook* because the number of countries for which adequate data were available was too small, and because of methodological difficulties.

EVALUATION OF QUALITY OF DATA[34]

Completely adequate statistics of international population movements would show the number of all persons having crossed an international frontier during a given period of time, the direction of their movements, and their characteristics. The data for different periods, or for different groups such as emigrants or immigrants, visitors and residents returning, would be consistent for any particular country, and comparable for different countries. This implies that uniform or equivalent statistical nomenclatures and methods of collection would be used, such as are described in the *Recommendations.* National series meeting those standards would readily fit in a set of international tables, giving complete and unduplicated representation of the movements of international travellers and migrants.

Existing data do not generally meet the standards of quality set forth in the *Recommendations.* They constitute only fragments of the complete representation of international migration and travel referred to above. Time will be needed to achieve a substantial improvement in migration statistics, since considerable administrative difficulties will have to be ironed out in many countries, but steady progress is possible. In effect, noticeable improvements have taken place during recent years in the geographic and time coverage, scope, consistency and comparability of statistics of international population movements made available by the various countries for publication in the *Demographic Yearbook.* A more detailed analysis of the limitations to which existing data are subject will now be given.

Geographic and time coverage

The number of countries for which data are shown for at least one year in any one of Tables 39 to 43 is 62. It would be desirable for several purposes that tables on international population movements should have an extensive geographic coverage, but it is still more desirable that they include sufficient data on the largest migratory movements taking place in the world. From this point of view, the coverage of Tables 39 to 43 is more satisfactory

[33] The text of the *Recommendations* is available in Chapter II of *International Migration Statistics,* United Nations, Statistical Office. Statistical Papers, Series M, No. 20, New York, 1953. Sales No. 1953.XVII.10.

[34] A detailed comparative analysis of the migration statistics of 69 countries or territories and an examination of the difficulties relating to them are available in *Problems of Migration Statistics,* United Nations, Department of Social Affairs. Population Studies, No. 5, Lake Success, 1949. Sales No. 1950.XIII.I. A discussion of the problems of organization and operations in migration statistics, including possible applications of sampling methods, is presented in *International Migration Statistics,* Statistical Papers, Series M, No. 20, cited above.

than would appear from the mere consideration of number of countries included.

The degree of completeness of the coverage varies between continents. Among the more significant omissions are Brazil and some other South and Central American countries for recent years, and most African and Asian countries or territories. In Europe, no statistics are available for France, recent data on the characteristics of continental migrants are lacking for Italy, and information on continental movements is not available for the United Kingdom.

While the collection of statistical information on travellers and migrants is generally a continuous operation, concomitant with the movements, important delays often occur in the processing of the data. These delays account for the gaps in the tables for the year 1953 and even for 1952. In view of the importance of current data in the field of migration, these gaps are regrettable and show the need to accelerate the processing of data. At the other end of the time period covered by the tables, that of the earliest years, gaps actually indicate progress in several cases, some countries having started only recently to compile the statistics considered here.

In conformity with paragraph 27 of the *Recommendations,* calendar-year series were preferred to those relating to fiscal years or other twelve-month periods. In the case of 2 countries, only data for non-calendar years were available and are included in the tables; for 2 other countries, certain classifications are shown for non-calendar years in the absence of preferred data, while other classifications are given for calendar years. The importance of limitations of this kind in the consistency and international comparability of data on international population movements has declined as a result of efforts recently made by several countries to make calendar-year tabulations available, sometimes in addition to the fiscal-year data that may be required by legislation.

For current migration data, sometimes compiled for periods shorter than a year, reference may be made to *Industry and Labour,* published twice each month by the International Labour Office.

Definitions and nomenclatures

Problems of definition and nomenclature are different in statistics of international population movements from those in other demographic statistics. Population census and vital registration data, at least elementary ones, relate to well defined events such as the presence of a person in a particular area, a birth or death. The crossing of an international frontier by a traveller likewise is a simple event to define; but it is not a very significant one in itself. The commonly used concepts of permanent emigrant and immigrant, temporary migrant and tourist, are largely conventional in the sense that they do not relate to obvious and easily recognizable characteristics of the travellers, which would make it possible readily to identify and enumerate those belonging in each category. The legal or administrative definitions vary greatly among countries and sometimes in the same country, according to context, although in most cases account is taken of whether or not the traveller is a resident of the country from which he departs or in which he arrives and of the purpose and expected duration of his sojourn.

In order to make it possible under these circumstances to collect statistics of international population movements and migration and to ensure that they possess a reasonable degree of consistency and international comparability, it is necessary to establish statistical nomenclatures defining precisely what is to be counted, adapted to the processes of data collection and tabulation, and also meeting the needs of users of statistical information in this field. The nomenclature used in Table 39 and in the requests for migration data sent by the International Labour Office to the various countries is substantially the same as that given in paragraph 17 of the *Recommendations.* Four major categories of departures and arrivals are distinguished therein; they are mutually exclusive, so that no person should be counted in more than one of them. The nomenclature is as follows:

Departures to other countries (except frontier traffic)

1. Total departures (sum of categories 2, 3, 4 and 5).
2. Permanent emigrants, i.e., residents (nationals and aliens) intending to remain abroad for a period exceeding one year.
3. Temporary immigrants departing (dependents being classified in category 4).
4. Visitors departing on completion of visit. This category may be subdivided according to the purpose of the visit.
5. Residents (nationals and aliens) intending to remain abroad for a period of one year or less.

– Special classes, i.e., separate figures for groups included in the above categories, to which a given country attaches special interest, for example: refugees or transferred population departing; emigrants enjoying special facilities such as government financial assistance, participation of inter-governmental organizations in cost of passage, facilities under bilateral or multilateral agreements.

Arrivals from other countries (except frontier traffic)

1. Total arrivals (sum of categories 2, 3, 4 and 5).
2. Permanent immigrants, i.e., non-residents (nationals and aliens) intending to remain for a period exceeding one year.
3. Temporary immigrants, i.e., non-residents intending to exercise for a period of one year or less an occupation remunerated from within the country (dependents being classified in category 4).
4. Visitors, i.e., non-residents intending to remain for a period of one year or less without exercising an occupation remunerated from within the country (including their dependents). This category may be subdivided according to the purpose of the visit.
5. Residents (nationals and aliens) returning after a stay abroad not exceeding one year.

– Special classes, i.e., separate figures for groups included in the above categories to which special interest attaches at a given time, for example: refugees; transferred population; immigrants enjoying special facilities such as government financial assistance, participation of inter-governmental organizations in cost of passage, facilities under bilateral or multilateral agreements.

Frontier traffic

It is seen that for statistical purposes, the *Recommendations* distinguish permanent migrants from other travellers by the fact that they change their country of residence for more than one year. Temporary migrants are distinguished from other travellers by the fact that they are moving to take employment abroad for one year or less; other persons going abroad for other purposes, for one year or less, are visitors.

The drawing of a line at one year to distinguish between "temporary" and "permanent" movements is widely accepted among countries where a systematic effort has been made to clarify migration statistics. However, in the marginal case of persons changing residence for exactly one year (e.g. with one-year employment contract with no intention to extend it), countries still use an older pattern of classification which includes the travellers concerned among permanent migrants instead of temporary migrants or visitors, as the case may be, in the 1953 nomenclature.[35]

Deviations from the above definitions are found in footnotes to Table 39 and, in some instances, to Tables 40 to 43. They result from variations in the concept of permanency or from limitations of the data to certain groups, such as aliens or nationals, or to certain types of movements such as continental or intercontinental migration, travel by sea or across land borders.

The interpretation value of the data and their international comparability are thus rather severely restricted. In some cases, the restriction corresponds to a serious deficiency in our knowledge of the number and characteristics of migrants. Supplementary information can then sometimes be derived from indirect sources, but this process may be painstaking and results are often of uncertain validity. In other cases, the restriction is somewhat formal, as when a group is excluded because it is too small to warrant the expense of statistical reporting, or was so considered when procedures for obtaining migration statistics were established. It is for each user to evaluate whether the missing element is or is not negligible for his particular purpose, whether it may not have become more important in recent years without collection procedures having been changed to permit its inclusion, whether the figures for groups such as nationals departing for overseas destination, or aliens arriving from overseas in third class accomodations, may not, under particular circumstances, be closely correlated with those for permanent emigrants and immigrants as defined above, etc.

The *Recommendations* also set forth, in their paragraph 19, the following sub-categories of visitors, based on the purpose of the visit:

(i) Visitors in transit

(ii) Visitors for holiday

(iii) Visitors for education

a. teachers under appointment by educational institutions

b. students attending regular sessions of educational institutions

c. other visitors for educational purposes (e.g. study tours, summer schools)

(iv) Visitors for business

(v) Other visitors

In paragraph 20 of the *Recommendations,* it is indicated that a distinction between workers and non-workers is desirable for frontier traffic.

These more detailed classifications are useful for various users of the statistics; they do not generally concern the basic information required in interpreting figures for the more important categories of permanent emigrants or immigrants, and need not be discussed here in further detail.

Sources of data

The materials presented in Tables 39 to 43 have been obtained generally by means of a questionnaire sent to governments by the International Labour Office. Supplementary information was extracted by the Secretariat from official publications and documents.

In the various countries, the data are drawn from a variety of sources. These are shown in Tables 40 to 43 by Roman numerals, according to a code which is also used in the International Labour Office *Year Book of Labour Statistics.* The code does not indicate degrees of reliability. The classification of sources and their code numbers are as follows:

I. Port statistics, provided by the shipping authorities and based on ship or aircraft manifests or other administrative documents made out by the navigation companies or, in some cases, on individual forms completed by each traveller or head of travelling family group.

II. Statistics of frontier control, provided by the police or immigration authorities supervising the crossings of international frontiers. In some cases, the data are based on individual forms.

III. Statistics based on coupons detached at points of departure and arrival from identity documents issued to migrants by their own country.

IV. Passport statistics; being the number of passports issued to certain categories of prospective travellers, these data are limited to national emigrants.

V. Statistics of local population registers, provided by the authorities in charge of the registers, are based on entries recording declarations of change of residence, which are compulsory under the laws of a few countries.

VI. Other statistics, including those obtained in connection with the enforcement of regulations concerning immigration, work-permits for aliens, transport contracts for emigrants, etc.

The diversity in the sources of statistics on international population movements corresponds, in a certain measure, to the variation in definitions analyzed at the beginning of the preceding section. This diversity complicates the interpretation of different series available for the same country and the making of international comparisons. Uniformity in the method of collection would therefore represent an improvement. In paragraph 13 of the *Recom-*

[35] In this respect, the 1953 *Recommendations* differ from the 1949 *Draft Recommendations for the Improvement of Migration Statistics* and *Resolutions* of the 1932 International Conference on Migration Statistics, but conform to proposals made in 1932 by the International Labour Office.

mendations, definite preference is given to collection at the occasion of frontier control for all countries except for the small number of those where satisfactory data on international population movements can be obtained from existing population registers. The application of the recommended method of collection would be facilitated by neighboring or related countries making arrangements for the joint compilation of the data. Paragraph 14 of the *Recommendations* directs the attention of governments to this point.

Data in Tables 40 to 43 are derived from the various sources with the following frequencies:

		Frequency[1]		
Code	*Source of the Statistics*	*Total*	*European countries*	*Non-European countries*
I and II	Port and frontier control	15	3	12
III	Coupons detached from identity documents	2	2	–
IV	Passports issued	3	3	–
V	Population registers	9	7	2
VI	Other sources	6	4	2
. . .	Source not stated	4	–	4
		39	19	20

[1] Data for 36 countries are shown in the tables. One European country uses three sources of statistics; another one, two sources. When several sources were shown as a result of reorganization in the methods of collection, only the source for more recent years is counted above.

The above table shows that outside Europe migration data are obtained in seventy per cent of the countries from reliable sources, frontier control and port statistics, and population registers. In Europe, a great diversity of methods prevails, reflecting the particular difficulty of collecting migration data in that continent as a result of the multiplicity of frontiers crossed by large numbers of travellers each year.

The preceding table is not readily comparable with the similar one included in the Introductory Notes to the 1948 edition of the *Demographic Yearbook.* One difference is that the nomenclature of sources now comprises only six classes, instead of seven in 1948. Statistics of transport contracts previously constituted source IV, but are now included among "other sources". Another difference is that the frequencies shown in 1948 related to 45 countries, of which 28 appeared in a general table on continental and intercontinental migration, now discontinued, and 17 in four tables corresponding to Tables 40 to 43 of the present edition of the *Yearbook,* now covering 36 countries. A comparison between the table published in 1948 and the one above, taking these differences into account, reveals no great improvement in the uniformity of methods for collecting migration statistics in the various countries, particularly in Europe where the problem is most serious.

Frequencies of collection methods I and II have been shown together in the above table because data obtained by these methods are often comparable. In general, no outright conclusion regarding the quality of migration data can be drawn from the mere indication of the source from which they were drawn. It is necessary to analyze in some detail the collection procedures followed by the country to determine what limitations may result from the procedures. Furthermore, in order to produce internationally comparable statistics, collection methods need not be identical but should be equivalent. In an island country, port statistics may give results comparable to frontier statistics in a country having only land borders. The latter type of data may, under certain conditions, be comparable with statistics from population registers. Only a detailed study of each case may reveal the reliability of the figures, and show how comparable they may be for different countries and periods of time.

Accuracy of the data

Besides limitations resulting from methods of collection and systems of definition, statistics of international population movements and migration are also affected by errors made at the time of collection and during processing. The accuracy of migration statistics is also limited by two factors not encountered in the case of other demographic data. First, the definitions of permanent emigration and immigration are based on intentions expressed by the travellers, who may subsequently change their plans. Secondly, it is known that clandestine movements occur across certain frontiers. They escape statistical recording, except perhaps in a very limited number of cases where provisions are made for including the persons concerned in the statistics, when their status is regularized.

The accuracy of statistics of permanent migrants cannot be checked effectively by finding out how closely they fit with the results of population censuses taken from time to time in a given country and the balance of births and deaths provided by the vital statistics system. This procedure is, in most cases, useless because the magnitude of migration in relation to natural increase and total size of population is so small as to fall within the margin of absolute error of vital statistics and census data that are fairly satisfactory on the basis of relative accuracy.

It remains possible to detect certain inaccuracies in migration data through unexplained irregularities brought out by comparison of figures for a series of years.

While travellers and migrants cannot be recounted at the point of their journey at which statistics were once collected by a particular country, migrants are usually counted by both the country of their last permanent residence and the country of their intended permanent residence. This double count affords an obvious means for evaluating the accuracy of migration data. Certain precautions are, however, required when attempting a comparison between the number of emigrants recorded by a country E as leaving for a country I and the number of immigrants recorded in country I as arriving from country E. The coincidence of the two figures would require perfect comparability. It is not surprising, therefore, that corresponding figures from Tables 40 and 41 should differ. In itself, this fact does not imply that the data lack in reliability and comparability to the point of being of little or no value. In order that corresponding emigration and immigration figures should be even approximately equal for any two countries, many difficult conditions would have to be met. The principal ones are: equivalence in all countries of methods of collection and definition of emigrant and immigrant, and compatibility of the respective

lists of countries of intended permanent residence and of countries of last permanent residence. Less fundamental conditions would also have to be satisfied, such as recording of persons changing their destination en route, of births and deaths during the period of travel, and adjustment of the data for differences in the time references of the questions put to the migrants at the places where the data are collected so as to deal with journeys extending beyond the end of a particular calendar year. However, even when all these conditions are not fulfilled, the data may be still useful for many purposes involving more limited international comparability.

The following table shows pairs of figures relating to migratory movements between selected countries for the year 1952, taken from Tables 40 and 41 respectively. The countries chosen are of some importance as areas of emigration or of immigration. It is seen that the extent of agreement and difference between corresponding figures varies considerably according to the particular countries considered. In many cases, it is possible to account for differences shown through a careful perusal of definitions given in Tables 40 to 41.

DESCRIPTION OF TABLES

Table 39

Statistics of international travellers classified in major categories of departures and arrivals are presented for the years 1948-1953 in Table 39 for 62 countries or territories. The basic importance of this classification has been emphasized in paragraph 8 of the *Recommendations* in the following terms: "From the point of view of statistical reliability and comparability, there would be great advantage in having total figures of arrivals and departures with a breakdown into major categories. The interpretation of the statistics for a given country becomes clearer when figures for different categories of arrivals and departures can be compared, especially over a number of years. Estimates for groups of persons not classified uniformly in the different countries may become possible and thus a certain degree of international comparability attained at a minimum cost. Utilization of the statistics in conjunction with other demographic data (census and vital statistics) is also much facilitated."

Major categories

The major categories of departures and arrivals listed in the stub of Table 39 conform to those of the internationally recommended nomenclature described above. In order to save space, the full designation of the major categories has not been repeated; for the same reason, categories for which no data were available for a particular country are not listed. Further definitions of the major categories for the various countries are given in footnotes when available. In particular, they include explanations of the terms "permanent" and "temporary" emigrants and immigrants. In the absence of contrary indication, data include national as well as alien travellers or migrants and relate to both continental and intercontinental movements, in accordance with paragraph 17 of the *Recommenations.*

If no other definition is given, it may be assumed that the figures printed on the same line as a country name represent the total departures or arrivals of international travellers, with the exception of frontier traffic. In order to facilitate the reading of the table, such figures have been printed in bold type, whether or not a breakdown into major categories, adding to the totals, was available.

Special classes

In general, figures given for a special class of travellers are included in those shown for one of the major categories listed in the stub of Table 39, in conformity with paragraph 17 of the *Recommendations.* The few exceptions to this practice are accounted for in footnotes or by the fact, readily apparent in the table, that, for the particular country and year, no major category is listed which can include the group reported among special classes. In some cases, several distinct groups are shown separately under special classes because special interest attaches to them

from various points of view. Since total figures for special classes would not in general be meaningful, they have not been shown in the table, and the "not applicable" symbol (.) has been entered in their place.

Limitations of the data

Since Table 39 constitutes the most extensive tabulation of statistics on international population movements given in the *Demographic Yearbook,* little can be added to the observations presented above on the limitations of these statistics in general. The table itself shows the existing deficiencies with respect to geographic and time coverage and scope of the data. It is seen that the geographic coverage varies greatly according to the major category considered. For example, only 6 countries present data on frontier traffic, but 26 have data on permanent emigrants or immigrants. The footnotes present many examples of deviations from standard definitions, such as exclusion of nationals or aliens, persons of certain races, air travellers, continental or intercontinental migrants. The value of the data for interpreting the statistics of a particular country and for making international comparisons is restricted by such limitations. It is however necessary to evaluate in each case the numerical importance of these restrictions in order to gauge the weight that must be given to them.

For the category of visitors for holiday, corresponding to tourist traffic, more detailed data are given in Table 141 of the United Nations *Statistical Yearbook 1954.* These data and those in Table 39 are not derived from the same sources, and differences, sometimes large, exist between them.

Table 40

This table presents for the years 1950-1953 emigration statistics of 28 countries or territoires, classified by country or territory of intended permanent residence. To save space, incomplete data for 3 additional areas are given in footnotes. Figures for the years 1947-1949, not hitherto available for publication in the *Demographic Yearbook,* are included so as to continue the series presented in previous issues.

Definition and source of data

The grand total of emigrants or departing travellers for any country of emigration shown in Table 40 may, in general, be readily identified in Table 39, and thus related to a major category of departures. As the definitions and other particulars of the major categories are available in Table 39, they are not repeated in Table 40. The differences that exist in a few cases between corresponding figures in the two tables have been noted in Table 40 and explained in almost every instance.

In the absence of statistics for permanent emigrants, data relating to total departures classified by country of destination are shown in Table 40 for certain countries. Except as otherwise indicated in Table 40, the data may be assumed to be classified by country of intended permanent residence. The various definitions of "permanent" follow from those given in Table 39 for permanent emigrants and immigrants.

The Roman numerals following the name of each country of emigration indicate the source of method of collection of the data, as is further explained on page 41.

Continental and intercontinental migration

Countries or territories of intended permanent residence continue to be grouped by continent in the stub of Table 40, and countries or territories of emigration have now been arranged in the same manner. As a result of this presentation, data pertaining to migration taking place within one continent or between any two given continents form easily identifiable blocks of figures. A table on continental and intercontinental migration is also included in the International Labour Office *Year Book of Labour Statistics.* It distinguishes between national and alien emigrants, but does not show countries or continents of intended residence. Corresponding totals in Table 40 *and in the Year Book of Labour Statistics* generally agree; differences can be explained by comparing definitions made available with each of the two tables.

When continental migration is excluded, as may be seen by a reference to Table 39 as explained above, the "not applicable" symbol (.) has been entered in Table 40 for all the countries of intended permanent residence situated in the same continent as the country of emigration concerned. A similar rule is followed in cases where intercontinental migration is excluded.

Residual groups

In accordance with paragraph 28 of the *Recommendations,*[36] a separate residual group designated as "unspecified" is now shown for each continent, in addition to the "continent unknown" group which includes emigrants for whom no intended residence is reported. This arrangement facilitates the interpretation of continental subtotals in Table 40, and makes the blocks of figures relating to each continent as self-contained as available information allows. The "unspecified" group of a particular continent includes emigrants for whom only the continent of intended residence is reported as well as emigrants intending to reside in countries that are not listed in the stub of Table 40 because of lack of space. If the number of emigrants involved in the last mentioned case is significant, it is given in a footnote.

Aggregate figures

Separate figures are sometimes not available for two or more neighboring or related countries of intended residence. In such cases, the aggregate for the countries concerned is given for one of them and the "not available" symbol(. . .) is entered for the others, with explanatory footnotes. This convention is extended to cases where figures are not separately available for the groups "unspecified" relating to two continents.

Limitations of the data

The data presented in Table 40 are subject to the limitations of migration statistics in general that were described above. Their international comparability is further restricted by deviations from the recommended standard with respect to intended permanent residence. Some countries do not classify emigrants according to the country in which they intend to settle; they merely record the country of destination in the voyage, which may be a

[36] "The classification . . . should be according to current national boundaries, Cf. 'Recommendations for Censuses of Population to be taken in or around 1950' in *Report of the Population Commission, Third Session* (E/805, annex A, part II, paragraph 5). Total figures relating to countries . . . not shown separately should be given by continents. The number of persons for whom no information is reported should be given in a distinct group. The classification by continents and countries should be based on the *Nomenclautre of Geographic Areas for Statistical Purposes* (United Nations, Statistical Papers, Series M, No. 1, 1949)."

country of transit. A small number of countries give figures for emigrants classified by country of citizenship or by ethnic group. There are correlations between these classifications and the classification by country of intended permanent residence. The degree of correlation depends on the circumstances of place and time; it cannot be determined except in the very rare cases where two or more types of classification are given together.

Table 41

This table presents for the years 1950-1953 immigration statistics of 27 countries or territories, classified by country or territory of last permanent residence. To save space, incomplete data for 3 additional areas are given in footnotes. Figures for the years 1947-1949, not hitherto available, are included as in Table 40 and for the same reason.

Observations relating to the presentation of Table 40 and to the limitations to which its content is subject are applicable to Table 41 if references to departures, emigrants, country of intended permanent residence, and country of destination are altered so as to relate respectively to arrivals, immigrants, country of last permanent residence, country of departure.

One country presents a classification of immigrants by country of birth instead of country of last permanent residence. How close the correlation between the two classifications may be is not known in this instance any more than in the case of the classification by country of citizenship or by ethnic group considered above in connection with Table 40.

Table 42

Statistics of emigrants for the years 1950-1953, classified by sex and age, are presented in Table 42 for 24 countries or territories. Data by sex or age only are shown when the cross-classification was not available. Figures for the years 1947-1949, not hitherto available for publication in the *Demographic Yearbook,* are given in footnotes so as to continue as many as possible of the series presented in previous issues of the *Yearbook* and in the comprehensive volume recently published by the United Nations under the title *Sex and Age of International Migrants: Statistics for 1918-1947.*[37]

Definition and source of data

The totals for both sexes for any country of emigration shown in Table 42 may, in general, be readily identified in Table 39, and thus related to a major category of departures. As the definitions and other particulars of the major categories are available in Table 39, they are not repeated in Table 42. The differences that exist in a few cases between corresponding figures in the two tables have been noted in Table 42 and explained in almost every instance.

In the absence of statistics for permanent emigrants, data relating to total departures are shown in Table 42 for certain countries.

The Roman numeral following the name of each country indicates the source or method of collection of the data, as is further explained on page 41.

Age groups

In paragraph 28 (i) of the *Recommendations,* preference is given to a classification by quinquennial age groups. In general, five-year age groups are shown in Table 42 up to age 29, five- or ten-year groups between ages 30 and 69, with a residual group for 70 and over. However, practices vary somewhat among countries, and different age groupings are given when they were the only ones for which data were available, so as not to limit unduly the geographic coverage of the table. The number of emigrants whose ages were not reported is given under age "unknown". In a few cases, the total shown for both sexes includes emigrants of unreported sex. Their number is shown in a note.

Limitations of the data

The data presented in Table 42 are subject to the limitations of migration statistics in general that were described above. Their international comparability is further restricted by some deviations from standard age groupings, and, in one case, by the fact that age at birthday following departure is reported instead of age at preceding birthday, which may be assumed to be shown for all other countries. The latter and more common practice is the one preferred in paragraph 28 (i) of the *Recommendations.*

Few difficulties arise in making a classification by sex. In effect, very few instances occur in Table 42 where figures relating to "sex unknown" are given, and then these figures are small. This would justify the conclusion that the distribution of migrants by sex is reliably described in the table. However, until recently children were not accounted for by sex in the migration records of some countries, and the sex classification may sometimes be less accurate for the lower ages than for the adult ages.

It is likely that misstatements of the ages of emigrants occur. Chances of inaccuracies are small when statistics are collected at the occasion of frontier control, as identity documents then have to be produced. Since data are presented in the table for rather broad age groups, the consequences of some of the inaccuracies in age reporting are eliminated. The numbers reported under age "unknown" are in general of moderate size in percentage of the total number of emigrants concerned. However, their magnitude is often considerable in relation to the number of emigrants in a given age group, and the possibility that omissions in age reporting may materially affect the accuracy of figures given for certain age groups cannot be overlooked. When no age "unknown" group is shown, it should not be concluded that perfect age reporting has been achieved; the number of persons of unknown age may have been distributed among the various age groups in proportion to their magnitude or according to some other rule. Definite information on this point is lacking.

Table 43

Statistics of immigrants for the years 1950-1953, classified by sex and age, are presented in Table 43 for 21 countries or territories. Data by sex or age only are shown when the cross-classification was not available. Figures for the years 1947-1949 not hitherto available, are given in footnotes as in Table 42 and for the same reason.

Observations relating to the presentation of Table 42 and to the limitations to which its content is subject are applicable to Table 43 if references to departures and emigrants are altered so as to relate respectively to arrivals and immigrants.

[37] United Nations. Department of Social Affairs. Population Studies, No. 11. New York, 1953. Sales Number 1953.IV.15.

Avant-propos

L'*Annuaire démographique* est une publication du Bureau de statistique de l'Organisation des Nations Unies. Il comprend des statistiques sur l'état et le mouvement (natalité, mortalité, nuptialité, divorces, migrations, tables de mortalité) de la population, un chapitre consacré à des "Considérations sur les tableaux statistiques", une bibliographie ainsi qu'un index des pays et un index des sujets. Les séries statistiques proviennent des questionnaires remplis par les services de statistique de tous les pays et "territoires" du monde, complétés parfois, lorsqu'il est possible, par des renseignements empruntés aux publications officielles des divers pays. A l'exception des statistiques des migrations internationales fournies par le Bureau International du Travail, toutes les séries sont rassemblées par le Bureau de statistique.

La sixième édition de l'*Annuaire* contient un ensemble de 44 tableaux distincts, c'est-à-dire qu'elle constitue celle qui en renferme le plus grand nombre à ce jour. Conformément au système de roulement que la quantité considérable de données nouvelles disponibles chaque année a imposé, cette édition présente des tableaux spéciaux sur la *natalité*. Outre 20 tableaux consacrés exclusivement aux statistiques des naissances vivantes et des mort-nés, on y trouvera également quatre tableaux relatifs à l'état de la population qui offrent un intérêt certain pour l'étude de la fécondité. Les séries statistiques dont la portée a été étendue ont été révisées et mises à jour (voir la liste des tableaux parus à la page 723) et les huit tableaux suivants figurent pour la première fois dans l'*Annuaire:*

Population mariée selon l'âge et le sexe (tableau 4)
Naissances vivantes légitimes selon l'âge de la mère (tableau 12)
Taux de natalité légitime selon l'âge de la mère (tableau 13)
Taux de natalité selon le rang de naissance et l'âge de la mère (tableau 19)
Mort-nés selon l'âge de la mère (tableau 24)
Taux de mortinatalité selon l'âge de la mère (tableau 25)
Mort-nés selon l'âge de la mère et le rang de naissance (tableau 26)
Taux de mortinatalité selon l'âge de la mère et le rang de naissance (tableau 27)

Les "Considérations sur les tableaux statistiques" ont été augmentées pour permettre une analyse plus détaillée de la qualité des données en général et de celles figurant dans chaque tableau en particulier. On a mentionné plusieurs fois dans l'*Annuaire* les ***Principes directeurs d'un système de statistiques de l'état civil***[1] qui renferment les recommandations pour l'amélioration et la normalisation des statistiques de l'état civil approuvées par le Conseil économique et social à sa septième session (avril 1953). Autant qu'il a été possible de le faire, les insuffisances des statistiques de l'état civil des divers pays présentées dans cet ouvrage ont été analysées en fonction de ces "Principes".

La bibliographie de cette édition est un supplément de celle, très complète, parue dans l'*Annuaire* 1953 et seuls les nouveaux ouvrages publiés depuis y ont été cités. Comme les précédentes, cette bibliographie a été établie par le "Census Library Project" du Bureau de recensement des Etats-Unis et de la Bibliothèque du Congrès.

En tant que source de données de base pour les démographes, les économistes et les spécialistes de la santé publique, l'*Annuaire démographique* ne doit pas être considéré comme un ouvrage isolé susceptible de répondre à tous les besoins mais plutôt comme l'un des éléments constitutifs d'une série de publications périodiques solidaires des Nations Unies et des Institutions spécialisées.

Les intérêts voisins des Nations Unies et de l'Organisation Mondiale de la Santé ayant respectivement pour objet le domaine étendu de la démographie générale et celui plus particulier des statistiques indispensables à l'étude des problèmes sanitaires forment la base d'une coopération étroite entre ces deux institutions pour le rassemblement et la publication des statistiques de l'état et du mouvement de la population et des données annexes. Dans le cadre d'un plan d'ensemble à l'échelle internationale l'*Annuaire démographique* de l'Organisation des Nations Unies constitue la source fondamentale d'informations relatives à la population pour le démographe et l'économiste. Certaines des données rassemblées pour l'*Annuaire démographique* sont réimprimées dans les publications de l'Organisation Mondiale de la Santé afin de les mettre à la portée du corps médical et des spécialistes de la santé publique. En outre, les publications de l'Organisation Mondiale de la Santé, particulièrement l'ouvrage périodique intitulé "Statistiques Epidémiologiques et Démographiques annuelles", contiennent des séries de données sur les décès par cause selon l'âge et le sexe; des séries spéciales sur les décès d'après certaines causes; des données détaillées sur les cas et décès dus aux maladies à déclaration obligatoire, et d'autres statistiques d'intérêt medical.

Ensemble, les publications des Nations Unies et de l'Organisation Mondiale de la Santé fournissent des renseignements sur les aspects les plus importants de l'état et du mouvement de la population ainsi que de la santé publique et elles doivent être utilisées concurremment si l'on désire disposer de données détaillées sur toutes les statistiques établies à cet égard par les divers pays du monde.

Le Bureau de statistique remercie le Service de la population de la Direction des affaires sociales de la préparation des estimations de la population des continents et principales régions du monde (tableau 1 A), du classement des estimations ainsi que de l'établissement et de l'application de la méthode permettant d'évaluer l'exactitude des statistiques de la composition par âge des populations (tableau I) exposée dans les commentaires se trouvant au début de ce volume.

[1] Nations Unies. Bureau de statistique. Document ST/STAT/SER.M/19, 26 août 1953, 31 p. (Numéro de vente: 1953.XVII.8).

CONSIDERATIONS SUR LES TABLEAUX STATISTIQUES

OBJET DES DONNEES

En général, les statistiques présentées dans l'*Annuaire* se rapportent au territoire actuel des unités politiques ou géographiques indiquées. Lorsque le territoire sur lequel portent les données est autre que celui de 1954, on a signalé à l'aide de notes dans quelle mesure il diffère du présent territoire du pays en cause. Par suite, en l'absence de note, il convient d'admettre que les statistiques sont relatives au territoire compris à l'intérieur des frontières actuelles du pays considéré, même si à l'époque envisagée la configuration géographique du territoire en question était différente de celle d'aujourd'hui.

Quelques exceptions à cette règle ont été commises dans le cas de rectifications de frontières d'importance secondaire qui n'ont pas été mentionnées en note dans tous les tableaux. Certaines de ces modifications territoriales qui n'ont pas fait l'objet d'une note sont, par exemple, la cession à la France par l'Italie en 1947 de parcelles de territoire frontalier ayant porté sur un très petit nombre de personnes non exactement connu, et le transfert d'une partie du territoire finlandais à l'URSS en 1940 et dans les années qui suivirent, ce qui n'affecta pas la continuité des données démographiques du fait que la population en cause quitta le territoire cédé. Dans tous les cas, ces modifications aussi bien que toutes celles de cet ordre ont été signalées dans le tableau 1 mais non dans les tableaux suivants où l'on a pensé que leur influence était négligeable. En conséquence, il est recommandé de se reporter à ce tableau si l'on désire connaître exactement les frontières géographiques des pays et territoires considérés.

En rassemblant des statistiques nationales pour les publier dans l'*Annuaire* on s'est proposé de présenter des données relatives à la population présente ou population de fait plutôt qu'à la population de résidence habituelle ou population de droit. Ainsi, sauf indication contraire, les séries comprennent les tribus vivant dans la jungle, les aborigènes, les nomades, les personnes déplacées, celles qui sont internées dans des camps, et les réfugiés. Une exception importante à ce principe a été faite en ce qui concerne les chiffres de population relatifs aux années de guerre. Dans ce cas et lorsque les statistiques nécessaires étaient disponibles, on a rectifié les chiffres correspondant à la population présente de manière à ce qu'elle englobe les forces armées nationales stationnées hors du pays mais non pas les troupes étrangères et les prisonniers de guerre ennemis s'y trouvant. Ces ajustements sont signalés dans les tableaux contenant les chiffres de population et aussi dans ceux où ces derniers sont utilisés pour le calcul des taux.

La population de fait "rectifiée", mentionnée précédemment, et le chiffre exact de la population de droit ne sont pas très différents l'un de l'autre. Le dénombrement de la population de droit comprend d'ordinaire les forces armées nationales à l'étranger mais pas les troupes étrangères stationnées dans le pays. Par suite, les chiffres signalés dans les tableaux comme relatifs à la "population de droit" peuvent être considérés comme correspondant à cette définition, sauf indication contraire. La principale différence entre le chiffre rectifié de la population de fait et le chiffre de la population de droit est que le premier comprend toute la population civile se trouvant dans le pays à un moment déterminé, quelle que soit sa résidence légale ou habituelle, tandis que le second englobe les résidents civils à l'étranger mais ne comprend pas la population civile non résidente qui se trouve dans le pays. Comme la définition du terme "résident" varie d'un pays à l'autre, il est parfois plus difficile de comparer les totaux relatifs à la population de droit que ceux qui portent sur la population de fait. Il convient d'ajouter cependant que, en temps normal, la différence entre les deux est relativement faible.[1]

PORTEE GEOGRAPHIQUE

Conformément aux recommandations du programme initial relatives au contenu de l'*Annuaire démographique*[2] on s'est proposé de rendre la portée géographique de chaque tableau aussi large que possible. A cet effet, des données ont été publiées pour des "zones d'enregistrement", "d'exploitation", etc., ainsi que pour quelques villes seulement quand il n'a pas été possible de faire mieux. Des restrictions à ce principe existent cependant dans les tableaux contenant uniquement ou en majeure partie des taux calculés en faisant le rapport des statistiques de l'état civil à la population, du fait que les deux éléments constitutifs de ces taux doivent être disponibles pour la même année et le même territoire pour que le pays en question puisse figurer dans le tableau. Faute des éléments officiels qui viennent d'être mentionnés la portée des tableaux renfermant les taux par âge tels que les tableaux 11, 15, 17, 19 et 29 ainsi que celle des tableaux relatifs à l'état matrimonial (tableaux 13, 33 et 35) ont été fortement limitées. Cela a également réduit dans une certaine mesure la portée qu'auraient pu avoir les tableaux présentant des taux bruts (voir également "Caractère officiel des données" un peu plus loin).

---

[1] On trouvera une analyse plus détaillée des notions de population de droit et de population de fait dans la publication intitulée *Méthodes de recensement de la population*, Organisation des Nations Unies, Département des questions sociales, Division de la population, et Département des questions économiques, Bureau de statistique, document ST/SOA/Série A, Etudes démographiques No. 4, Lake Success, New-York, novembre 1949, p. 6 à 13.

[2] Organisation des Nations Unies, *Rapport de la Commission de la population* (deuxième session). Document des Nations Unies E/571, annexe A, p. 11.

Un autre facteur qui a eu tendance à restreindre la portée géographique des tableaux consiste en l'omission de régions et territoires pour lesquels les nombres sont très petits. Bien qu'aucun critère constant n'ait été suivi, les taux bruts et autres reposant sur des effectifs inférieurs à 15 n'ont généralement pas été calculés. Il en a été de même pour les indices relatifs à certaines caractéristiques tels que l'âge ou le rang de naissance qui n'ont pas été calculés lorsque la répartition considérée portait sur des effectifs inférieurs à 50. Toutefois cette règle n'a pas toujours été observée en ce qui concerne les tableaux sur la natalité, qui est le sujet auquel on a fait une place spéciale dans cette édition.

NOMENCLATURE

Les noms des différentes régions pour lesquelles des données sont présentées sont ceux d'acceptation courante. Faute de place et pour des raisons d'ordre pratique, les noms de pays sont généralement donnés sous leur forme abrégée dans la mesure où celle-ci est universellement reconnue et d'usage courant. Ainsi, la République des Philippines est désignée sous le nom de "Philippines", les Etats-Unis du Brésil sous celui de "Brésil", les Etats-Unis d'Amérique sous celui de "Etats-Unis", le Royaume Hachémite de Jordanie sous celui de "Jordanie" et le Royaume-Uni de Grande-Bretagne et d'Irlande du Nord sous le nom de "Royaume-Uni". Pour la même raison, la République fédérale allemande et la République démocratique allemande figurent respectivement dans les tableaux sous le nom d'Allemagne Occidentale et d'Allemagne Orientale. Une note se trouvant au bas du tableau I donne d'ailleurs la désignation exacte et la composition de ces deux unités politiques.

Les modifications survenues dans les noms de pays pendant le premier semestre de l'année 1954 ont été généralement reproduites dans cette édition de l'*Annuaire*. Ainsi, "Indochine" fait place aux trois désignations distinctes de "Cambodge", "Laos" et "Vietnam". L'Ethiopie et l'Erythrée figurent en tant que fédération dans les tableaux, tandis que "Brunéi', "Bornéo du Nord" et "Sarawak" y apparaissent séparément au lieu d'être groupés sous "Bornéo britannique". La fédération qui s'est produite le 23 octobre 1953 entre la Rhodésie du Nord, la Rhodésie du Sud et le Nyassaland constitue cependant une exception notable. Pour des raisons d'ordre pratique on a décidé de continuer à présenter ces territoires séparément, c'est-à-dire, sous leurs anciens noms de Rhodésie du Nord, Rhodésie du Sud et Nyassaland.

DISPOSITION DES PAYS

A l'exception des tableaux 1 et 39, la disposition des pays dans la colonne de gauche et dans les en-têtes des tableaux a été complètement remanieé pour cette édition de l'*Annuaire*. Dans le tableau 1, toutes les unités politiques ou géographiques du monde présentées par continent continuent à être groupées alphabétiquement d'après leur statut politique. Les pays se trouvent dans le tableau 39 dans l'ordre alphabétique anglais. Les changements introduits dans la disposition des pays affectent les autres tableaux où les unités politiques ou géographiques pour lesquelles on publie des données figurent dans l'ordre alphabétique anglais sous chaque continent. La distinction entre pays "souverains" et "autres" n'a pas été maintenue bien qu'il soit toujours possible de reconnaître les territoires non autonomes aux initiales de l'autorité administrative qui apparaissent entre crochets après leur nom.

EVALUATION DE LA QUALITE DES DONNEES

Comme dans les éditions précédentes de l'*Annuaire*, les dernières estimations officielles de population, en l'occurence celles de 1952-54, ont été classées par type d'estimation et les statistiques de l'état civil ont été évaluées en fonction du caractère plus ou moins complet de leurs données de base. Des détails sur ces deux classifications sont fournis un peu plus loin dans le paragraphe qui s'y rapporte. Pour gagner de la place et pour des raisons d'ordre pratique, le code permettant de distinguer les différentes catégories d'estimations de population ne figure que dans le tableau 1 et celui d'après lequel on évalue la qualité des statistiques de l'état civil ne se trouve que dans les tableaux qui indiquent l'évolution à long terme des naissances vivantes, des décès, de la mortalité infantile, des mariages et des divorces, c'est-à-dire, dans les tableaux 8, 9, 28, 31, 32 et 34. Bien que ces codes n'accompagnent dans chaque cas qu'un tableau déterminé, il va sans dire qu'ils s'appliquent également aux données correspondantes publiées pour les mêmes années dans tous les autres tableaux. De ce fait, lorsque l'on utilise les statistiques d'un de ces tableaux il convient de se reporter au tableau correspondant qui retrace l'évolution à long terme du mouvement de la population si l'on désire avoir une idée de la qualité des données pour le territoire considéré. Afin da faciliter ce renvoi, le numéro du tableau à consulter est indiqué dans la note explicative qui se trouve en tête des tableaux.

On a conservé également un autre signe réintroduit dans l'édition 1953 de l'*Annuaire*. Il s'agit d'une croix (†) pour distinguer les statistiques classées d'après l'année de l'enregistrement de celles se rapportant à l'année de l'événement. On ne saurait trop insister sur l'importance de cette distinction particulièrement en ce qui concerne les naissances vivantes. Un exposé détaillé des incidences de cette classification se trouve à la page 62.

CARACTERE OFFICIEL DES DONNEES

Toutes les données de base présentées dans l'*Annuaire* sont des statistiques officielles fournies par les gouvernements. Afin d'établir une certaine comparabilité dans les méthodes de calcul, tous les taux autres que les valeurs des fonctions considérées dans les tables de mortalité et les taux de reproduction, à l'exception d'un ou deux cas d'importance secondaire signalés dans les tableaux, ont été calculés au Bureau de statistique de l'Organisation des Nations Unies selon la méthode décrite plus loin dans le paragraphe qui s'y rapporte.

En général, les séries démographiques utilisées pour calculer les taux sont des résultats de recensements ou des estimations officielles publiés dans l'*Annuaire;* les taux bruts reposent sur les chiffres de population publiés dans le tableau 2 et les taux selon l'âge et le sexe sur ceux figurant au tableau 3. En ce qui concerne l'évolution des taux bruts, il convient de noter que, dans certains cas, les estimations de population utilisées pour le calcul des taux relatifs aux périodes comprises entre les derniers recensements n'ont pas encore été alignées sur les résultats des recensements effectués entre 1950 et 1953. Par suite, les

taux sont susceptibles d'être modifiés lorsque les estimations révisées deviendront disponibles. Comme le numérateur de ces taux restera ce qu'il est dans la plupart des cas, ils ne sont pas signalés comme provisoires; il y aura lieu de se reporter au tableau 2 "Estimations de la population totale", où les estimations non révisées sont indiquées par un paragraphe (§) si l'on veut pouvoir distinguer les taux en question.

DISPARITES ENTRE LES TABLEAUX

En préparant les tableaux pour la publication on a constaté que parfois, pour une même région et une même date, les statistiques de la population ayant trait à différentes caractéristiques ne concordaient pas. La plupart de ces différences ont été corrigées et on a rétabli la concordance des données en cause en se reportant à la source ou en se mettant en rapport avec les gouvernements intéressés. Néanmoins, il subsiste encore quelques divergences que l'on a signalées dans les tableaux en expliquant l'origine des écarts lorsqu'on a été en mesure de la déterminer.

SUPERFICIE ET POPULATION

EVALUATION DE LA QUALITE DES DONNEES

Les données sur la population totale figurent dans les tableaux 1 à 7 de l'*Annuaire* alors que la superficie des territoires considérés n'est indiquée que dans le tableau I. Les chiffres de population présentés sont des résultats de recensements et des estimations. Une analyse de la méthode d'estimation de la population basée par exemple sur les résultats de recensements ou dérivée d'autres sources a fourni un code assez précis permettant d'évaluer la qualité des données. Ce code est publié au tableau 1 seulement mais il peut être appliqué aux estimations correspondantes qui se trouvent dans les tableaux 2 et 3.

Le classement des estimations d'après-guerre suivant les différents types d'estimations qui a été introduit dans l'édition 1949-50 de l'*Annuaire,* a été complètement revu et corrigé là où c'était nécessaire pour l'édition 1952 et modifié conformément aux nouveaux renseignements reçus depuis, pour être inséré dans la présente édition. Le code est similaire à celui utilisé dans les éditions antérieures à 1952 mais il a été révisé pour tenir compte des recensements effectués en 1950 et postérieurement à cette date dans de nombreux pays, ainsi que pour éliminer certains facteurs secondaires jusqu'ici pris en considération. Ainsi, dans le cas des recensements, le degré d'actualité est de première importance si les adaptations chronologiques reposent sur les statistiques de l'état civil et les données relatives aux migrations; cette caractéristique et la fréquence entrent toutes deux en ligne de compte si le procédé d'adaptation est une extrapolation mathématique.

Code relatif aux types d'estimations:

Comme auparavant, le code est composé de deux éléments. Le premier, représenté par une lettre, indique la nature des données de base conformément à la classification ci-après:

R. Registres permanents de population.

A. Recensements, le dernier ayant été effectué après le 1er janvier 1950.

B. Recensements, le dernier ayant été effectué entre le 1er janvier 1945 et le 1er janvier 1950.

C. Recensements, le dernier ayant été effectué avant le 1er janvier 1945.

D. Dénombrements différents d'un recensement ou recensements partiels.

E. Evaluations conjecturales obtenues par d'autres moyens que des dénombrements.

Le second élément du code représenté par un chiffre de 1 à 8, indique le procédé employé pour adapter les données de base à d'autres dates et, lorsque la méthode utilisée consiste en une "opération de synthèse" (c'est-à-dire un ajustement au moyen des statistiques des naissances, des décès et des migrations), la qualité des chiffres dont on s'est servi pour effectuer l'ajustement. Quand les données de base relatives au chiffre de la population sont fournies chaque année, ce qui est généralement le cas lorsqu'il existe un registre permanent de population, aucune correction ne s'impose et le deuxième élément du symbole, dans le code est 0. Les procédés d'adaptation chronologiques sont classés de la façon suivante:

0. Aucun, données de base fournies annuellement, adaptation inutile.
1. Statistiques relativement exactes des naissances et décès, et (à l'occasion) données assez complètes sur les migrations.
2. Statistiques relativement exactes des naissances et décès: données sujettes à caution ou incomplètes sur les mouvements migratoires, ou aucun relevé de ces déplacements de population.
3. Statistiques des naissances et décès de qualité inconnue (il n'est pas tenu compte de l'exactitude des données relatives aux migrations).
4. Statistiques des naissances et décès signalées comme incomplètes (il n'est pas tenu compte de l'exactitude des données relatives aux migrations).
5. Extrapolation ou intrapolation mathématique, trois recensements au moins ayant été effectués depuis 1900.
6. Extrapolation ou intrapolation mathématique moins de trois recensements ayant été effectués depuis 1900.
7. Taux d'accroissement présumés, non dérivés d'une extrapolation mathématique.
8. Pas d'adaptation, donnée de base utilisée en permanence.

. . Procédé d'adaptation inconnu.

Partie alphabétique. — En général, la qualité des estimations diminue à mesure que l'on emploie de nouvelles lettres et que le chiffre est plus élevé. Ainsi, la formule "R0" du code indique que les estimations ont été obtenues directement de registres de population et qu'elles peuvent être considérées comme particulièrement bonnes. On entend par registre permanent de population, un système d'enregistrement dans lequel un dossier est constitué pour chaque individu, un nouveau dossier étant ouvert à chaque naissance, un autre clos à chaque décès, des dispositions étant prises pour faire suivre les dossiers lors des changements de résidence. Dans la mesure où le chiffre de la population totale a de telles sources, la précision des estimations est relativement indépendante de la périodicité et du caractère plus ou moins récent des recensements de population ou de la compilation des

U. OF I.
LIBRARY

statistiques des naissances et des décès à partir d'autres documents. En général, les estimations ayant pour base les enregistrements effectués dans les registres de population sont supérieures à celles fondées sur des recensements, tandis que les dénombrements autres que des recensements conduisent à des estimations encore moins bonnes.

Les estimations qui reposent sur des recensements sont signalées par les lettres "A", "B" ou "C" suivant la date du dernier d'entre eux, ainsi qu'on l'a indiqué précédemment. Aucune distinction n'a été faite quant à la qualité des recensements effectués mais il est évident que tous n'ont pas le même degré de précision.

Les estimations qui sont fondées sur des dénombrements autres que des recensements ou sur des recensements partiels sont désignées par la lettre "D". Cette catégorie couvre un assez grand nombre de genres d'estimations, y compris les chiffres des services de rationnement, les statisques fiscales, les dénombrements d'habitations, partiels ou par groupes, tels qu'ils sont pratiqués dans un certain nombre de territoires africains où la famille vivant sous un même toit, la tribu ou le village constituent autant d'unités de calcul. La précision de tels dénombrements varie considérablement, mais du fait qu'ils portent sur des groupes, ils doivent être considérés comme produisant des résultats inférieurs à ceux obtenus par la méthode d'énumération individuelle propre aux recensements. Lorsque ces dénombrements sont effectués tous les ans ("D0"), la répétition annuelle de l'opération a des chances d'améliorer le degré d'exactitude.

Les estimations fondées sur des conjectures ou des suppositions sur le chiffre de la population, faites à une certaine époque dans le passé, sont désignées par la lettre "E". De telles estimations doivent être considérées comme de simples indications sommaires sur l'importance probable de la population.

Partie numérique. — La partie numérique du code se compose de trois sortes d'adaptations chronologiques. La première d'entre elles, ajustement sur la base des statistiques des naissances, des décès et des migrations, est indiquée par le nombre "1" si les données sont tenues pour exactes par des sources officielles ou autres dignes de foi, par "2" si les éléments de l'accroissement naturel de la population sont correctement fournis mais si l'adaptation manque pour les migrations ou bien repose sur des informations insuffisantes, par "3" si l'on ne connaît pas la valeur des données relatives aux naissances et aux décès, et par "4" si l'on sait pertinemment qu'elles sont défectueuses. Pour "3" et "4" on ne tient pas compte de la qualité des données concernant les migrations.

La seconde catégorie, qui consiste en une interpolation ou une extrapolation mathématique de deux calculs de population ou plus, est en somme un procédé inférieur au premier, sauf dans le cas où les statistiques de l'état civil et des migrations sont incomplètes. Le type de courbe sélectionné et la longueur de la période comprise entre deux recensements ou écoulée depuis le dernier recensement utilisé comme base de calcul ont également une certaine influence sur la précision des estimations obtenues. Comme le fait de disposer de plus de deux recensements permet de mieux connaître l'évolution de la population dans le passé et laisse plus de latitude dans le choix de la courbe, une distinction est faite entre les pays avant effectué au moins trois recensements depuis 1900, indiqués par le chiffre "5", et ceux dans lesquels moins de trois de ces opérations ont été exécutées ("6").

La troisième sorte d'adaptation, taux d'accroissement présumé non dérivé d'une interpolation ou d'une extrapolation mathématique, est désignée par le chiffre "7". Les estimations obtenues de cette façon peuvent contenir des erreurs considérables surtout si le procédé est appliqué longtemps. C'est là un système généralement employé lorsque l'absence de données de base ou de renseignements relatifs aux changements de population ne permet pas de recourir à une méthode plus éprouvée.

Une estimation dont la valeur a été maintenue identique à celle de la donnée de base, indiquée par le chiffre "8", est en général celle à laquelle on peut le moins se fier. Elle est souvent la caractéristique d'un défaut de renseignements sur le chiffre exact de la population aussi bien que sur les taux de variation qui lui sont applicables.[3]

Valeur du code. — Les combinations variées de lettre et de chiffres ne constituent pas forcément une gradation descendante allant des données les meilleures aux moins bonnes. Ceci, non seulement à cause des facteurs énumérés dans le paragraphe précédent, mais aussi parce qu'une série d'estimations peut se trouver dans une position privilégiée à l'égard d'une partie du code et moins favorable par rapport à l'autre. Il est difficile sinon impossible de classer de tels cas selon une échelle de valeurs. Toutefois, on peut dire avec quelque certitude que l'association de "R", "A", "B", avec "0", "1", et "2" est la marque d'estimations auxquelles ou peut se fier, que les combinaisons de lettres et de nombres se trouvant à la partie inférieure de l'échelle sont le signe de données de qualité discutable, et que les autres associations représentent des variations assez larges dans l'échelle des valeurs.

Application du code. — Bien que le code ne figure que dans le tableau 1, il s'applique à toutes les estimations relatives aux années 1952-1954 où qu'elles se trouvent dans l'*Annuaire*. Si la méthode employée pour une de ces années diffère de celle décrite et qu'on la connaisse, le symbole pertinent du code est indiqué en note au bas du tableau 1. D'ailleurs, même si l'on n'a pu s'assurer exactement de la méthode employée pour obtenir les autres estimations on peut raisonnablement supposer que la classification donnée s'applique à l'ensemble des séries d'après-guerre (1947-1953), les pays étant généralement fidèles aux procédés utilisés pendant plusieurs années successives.

Exactitude des statistiques classées par âge et par sexe

Pour de nombreux pays, les statistiques relatives à la composition de la population par âge et par sexe présentent certaines irrégularités parmi lesquelles on peut citer: 1) des lacunes dans le dénombrement des nourrissons et des jeunes enfants, 2) un gonflement des déclarations d'âges se terminant par le chiffre 0 ou le chiffre 5, 3) une préférence pour les âges pairs aux dépens des âges impairs, 4) un écart considérable et inattendu entre le nombre de personnes du sexe masculin et celui du sexe

[3] On trouvera des explications plus détaillées sur les éléments du code dans le document suivant: *Méthodes d'estimation de la population totale à une date actuelle*, Manuel 1, Méthodes d'estimation de la population, Organisation des Nations Unies, Département des questions sociales, Division de la population, Document ST/SOA/Série A, Etudes démographiques No 10, New-York, 1952, 45 pages.

féminin à certains âges et 5) un écart considérable et difficile à expliquer entre les effectifs de groupes d'âge successifs ou voisins. Certaines de ces irrégularités sont atténuées ou disparaissent lorsque l'on combine les données par groupes d'âge quinquennaux, mais les lacunes du dénombrement des jeunes enfants, les anomalies dans la proportion des sexes et certaines des fluctuations numériques restent apparentes.

Si l'on procède, pour des recensements successifs, à une comparaison des statistiques relatives à des groupes identiques ainsi qu'à une étude de la répartition par âge et par sexe qu'indique chaque recensement, on peut relever de ces inconséquences et d'autres anomalies dont certaines se retrouvent même dans les recensements les plus "modernes". L'examen des données par âge et par sexe reproduites dans cet *Annuaire* et dans ses éditions antérieures montre que, dans certains cas, les statistiques présentent à cet égard des imperfections notables.

Au cours de l'année 1952, on a établi une méthode permettant d'apprécier de façon générale l'exactitude des statistiques de la population classée par âge et par sexe qui sont produites par les recensements. Cette méthode repose sur la certitude que, sauf là ou des conditions anormales ont existé, de brusques variations dans les nombres relatifs à des groupes d'âges quinquennaux consécutifs ou dans la proportion des sexes, indiquent des inexactitudes dans les déclarations d'âge.

Les deux difficultés principales rencontrées dans l'application de cette méthode résident dans la détermination des limites entre lesquelles de telles fluctuations peuvent être admises et dans la connaissance imparfaite des conditions anormales dans l'histoire des populations étudiées. A la suite de ces considérations, les répartitions par âge et par sexe soumises à ce contrôle ont été groupées en de larges catégories dans lesquelles une marge substantielle a été laissée aux variations accidentelles et aux autres déviations de la structure présumée. Dans les cas où des circonstances exceptionnelles sont entrées en jeu (par ex., pénuries d'hommes dans certains groupes d'âge à cause des pertes de guerre ou distorsions introduites par les migrations internationales dans la composition par âge et par sexe) les groupes d'âge atteints n'ont pas figuré dans les calculs.

On a procédé de la façon ci-après:

1. Les taux de régularité des groupes d'âge ou (rapports des groupes d'âge) ont été calculés séparément pour chaque sexe en divisant chaque groupe d'âge quinquennal entre 5 et 70 ans par la moyenne arithmétique des deux groupes d'âge quinquennaux adjacents. On a ensuite fait la moyenne des pourcentages d'écart, positifs ou négatifs, de chaque taux par rapport à l'unité; celle-ci représente "l'indice de régularité des âges."

2. Les taux de masculinité (c'est-à-dire, le nombre d'individus du sexe masculin pour 100 du sexe féminin) ont été calculés dans chaque groupe d'âge quinquennal entre 0 et 70 ans et on a retranché chacun d'eux de celui du groupe d'âge précédent. La moyenne de ces différences (sans tenir compte du signe) représente "l'indice de régularité des sexes."

3. Les deux nombres indices (celui relatif à l'âge et celui relatif au sexe) ont été combinés par addition afin d'obtenir un nombre indice général ou "indice combiné" valable pour une population donnée répartie selon l'âge, l'indice de régularité des sexes étant pondéré par 3.

Certains ajustements ont été introduits dans le calcul de l'indice lorsqu'une partie de la répartition par âge d'une population donnée consistait en groupes d'âge de 10 ans. Dans le cas de petites populations une marge a été laissée aux variations accidentelles de faible importance. Les répartitions par âges de populations inférieures à 5 000 unités n'ont pas été affectées d'un indice.

Les calculs pour un grand nombre de répartitions par âges de populations des types les plus divers ont conduit à la tentative de classification suivante:

		Indice combiné
I.	Données sujettes à des variations faibles ou moyennes.....	inférieur à 20
II.	Données sujettes à des variations relativement fortes.....	20 à 39,9
III.	Données sujettes à des variations extrêmes ou très prononcées.....	40 et plus

Un exposé plus complet des considérations théoriques servant de base à cette méthode d'appréciation de l'exactitude des statistiques de la composition par âge des populations se trouve dans le numéro 2 du *Bulletin démographique*[4] sous le titre "Méthodes permettant d'apprécier l'exactitude de la répartition par groupes d'âge quinquennaux et décennaux établie à la suite des recensements". Les résultats de l'application de cette méthode aux compositions par âge obtenues par recensement qui ont paru dans les éditions 1949-50 et 1951 de l'*Annuaire démographique* sont publiés dans cet article tandis que ceux de son application aux statistiques de l'édition 1952 de l'*Annuaire* ont été indiquées dans la précédente édition. Les résultats de l'application de la méthode aux recensements et estimations présentés au tableau 3 paraîtront ultérieurement, dans un autre volume.

DESCRIPTION DES TABLEAUX

Tableau 1

Le premier tableau de l'*Annuaire* contient des données sur la population totale, la superficie et la densité de tous les pays et territoires du monde. On y a indiqué pour chacune des unités politiques ou administratives au sujet desquelles on a pu se procurer des chiffres officiels, les résultats du dernier recensement de population ainsi que les estimations de la population au milieu de l'année pour une année d'avant guerre (1937), et pour trois années d'après guerre, 1952, 1953 et 1954. Dans un petit nombre de cas, on a publié des estimations non officielles pour 1953 pour que le tableau soit plus complet du point de vue géographique et pour donner au moins une idée du chiffre de la population de chaque territoire. Ces estimations non officielles sont signalées dans le tableau par le signe (x). La seule autre exception aux principes énoncés plus haut se produit lorsqu'un chiffre de population présenté comme une estimation établie au milieu de l'année civile est en réalité la moyenne de deux estimations successives de fin d'année plutôt qu'une estimation spécialement établie au 1er juillet. Aucune distinction n'est

[4] Organisation des Nations Unies, Département des questions sociales, Division de la population, document ST/SOA/Ser.N/2, New-York, octobre 1952, p. 59 à 79.

faite entre ces deux sortes d'estimations au milieu de l'année, les différences en cause étant négligeables. Cependant, les estimations se rapportant à une date autre que le milieu de l'année font l'objet d'une note au bas du tableau.

Colonne de gauche

La colonne de gauche du tableau 1 est la plus complète au point de vue géographique de tous les tableaux de l'*Annuaire*. On a essayé d'y faire figurer, dans la mesure du possible, les parties ou éléments qui constituent chaque "ensemble" de territoires. Dans les éditions précédentes, les données se rapportant aux territoires faisant partie d'une unité géographique ou politique plus grande figuraient entre parenthèses pour indiquer qu'elles se trouvaient comprises dans le total relatif au pays considéré apparaissant plus haut. Afin de simplifier la présentation, les parenthèses ont été supprimées dans cette édition de l'*Annuaire* et on a utilisé des caractères d'imprimerie plus petits pour distinguer ces différents territoires. Lorsqu'il n'a pas été possible de présenter séparément les éléments d'un "ensemble" géographique ou politique, sa composition est donnée en note. Des notes supplémentaires fournissent, cette année, des précisions sur les départements (ou provinces) d'outre-mer espagnols et portugais. La composition de l'Inde française et portugaise ainsi que celle de l'Océanie française sont également mentionnées en note.

Dans le tableau 1 les territoires sont aussi présentés d'après leur statut politique, c'est-à-dire, en tant que souverains, non-autonomes, sous-tutelle, condominiums, ou placés sous une administration internationale ou militaire. Dans la mesure du possible, les désignations reflètent la situation en 1954. Cependant, on n'a pu tenir compte dans cette édition des modifications survenues vers la fin de l'année. Ainsi, bien que la révision du statut de Trieste en octobre 1954 et le transfert de l'administration de l'Inde française qui eut lieu en novembre, aient été signalés dans des notes au bas du tableau, ces territoires y figurent encore avec leur ancien statut. Lorsque la révision du statut entraîne le passage d'un territoire d'un continent à un autre du point de vue de la classification (par exemple, intégration du Groenland devenu département danois) on s'est borné à indiquer cette modification en note sans rien changer à la disposition des pays dans le tableau. De même, malgré la proclamation en 1953 d'une fédération entre la Rhodésie du Nord, la Rhodésie du Sud et le Nyassaland on a jugé plus pratique de continuer à faire figurer ces pays séparément dans le tableau d'autant plus que les séries statistiques les concernant n'ont pas encore été intégrées. Ainsi le tableau 1 peut être considéré, grâce à la classification précitée et aux notes abondantes qui décrivent d'une manière beaucoup plus détaillée qu'ailleurs les divers territoires, comme le tableau de référence du volume pour ce qui est de la composition et de la disposition des différents pays et territoires mentionnés dans l'*Annuaire*.

Chiffres de recensements

Dans la mesure du possible, les chiffres se trouvant dans la colonne des recensements du tableau 1 correspondent à la population effectivement dénombrée lors du dernier recensement "véritable" qu'il ait ou non porté sur la superficie totale du pays, sur une fraction de cette superficie ou qu'il n'ait touché qu'une certaine partie de la population. Par "véritable" recensement on entend, en général, celui qui a été effectué à l'aide de questionnaires individuels ou familiaux, bien que quelques recensements "par groupes" aient été retenus lorsqu'on a su qu'ils avaient été exécutés dans des conditions scientifiques. On a indiqué en note les estimations officielles pour les groupes non recensés et celles établies pour évaluer les lacunes des dénombrements.

Estimations

Sauf indication contraire, les estimations de population pour 1937 et pour les années 1952 à 1954 se rapportent à la population présente "rectifiée" (voir "Objet des données" page 49). Le code relatif aux "types d'estimations" qui a également été mentionné précédemment se trouve dans ce tableau et s'applique à chaque estimation officielle établie pour 1952-1954 sauf exceptions signalées en note. Les renseignements que l'on possède sur les lacunes des dénombrements accompagnés du code sur les "types d'estimations" permettent d'évaluer de manière assez précise la qualité des estimations officielles de population d'après guerre qui sont publiées également dans le tableau 2.

En l'absence d'une estimation officielle de population le tableau 1 fournit un chiffre de recensement chaque fois que cela est possible. Les chiffres de recensements figurent en italiques dans la colonne réservée aux estimations afin de les distinguer des estimations de la population au milieu de l'année.

Superficie et densité

Les données relatives à la superficie, exprimées en kilomètres carrés, correspondent à la superficie totale des unités politiques ou géographiques considérées, y compris les eaux intérieures et les régions inhabitables ou inhabitées que peut comprendre le territoire en question. Les régions entièrement inhabitées, telles que les régions polaires et certaines petites îles, ne sont pas mentionnées dans le tableau et ne sont évidemment pas comprises dans les statistiques. Ces estimations de la superficie sont des chiffres officiels, sauf si elles sont accompagnées du signe (x). Les superficies communiquées en milles carrés ont été converties en kilomètres carrés.

Les disparités existant entre les chiffres de superficie de ce volume et ceux figurant dans le tableau correspondant de la dernière édition de l'*Annuaire* sont relativement faibles et peuvent être considérées principalement comme le résultat de nouveaux calculs de la superficie des territoires considérés et de l'amélioration des estimations. Cependant, dans quelques cas, les modifications de la surface terrestre proviennent de récupérations et de gains de terrain.

La densité de la population, c'est-à-dire le nombre d'habitants par kilomètre carré de superficie totale, est indiquée pour toutes les unités politiques ou géographiques. Dans les éditions antérieures, la densité n'avait été calculée que pour les unités politiques ou géographiques ayant une superficie égale ou supérieure à 1 000 kilomètres carrés. L'abandon de cette restriction a permis la publication de la densité de plus de 50 nouveaux territoires.

Une autre modification introduite consiste dans l'utili-

sation comme base de calcul de la densité de l'estimation de population pour 1952 lorsque celle relative à 1953 n'est pas disponible. Comme la densité n'est pas affectée d'une façon sensible par une légère variation de l'effectif de la population, on a pensé qu'une densité reposant sur une estimation de population établie pour 1952 serait satisfaisante. D'ailleurs les chiffres de densité ne sont que des indices assez sommaires du nombre de personnes par unité de superficie car ils ne reflètent en aucune manière la concentration de la population dans certaines zones particulières du territoire ou pays considéré.

Tableau 1A

Ce tableau présente des estimations de la population de chaque continent par régions, à intervalles décennaux de 1920 à 1950 et pour l'année 1953, ainsi que des données sur la superficie en kilomètres carrés; ces statistiques sont accompagnées de l'indication du nombre de personnes au kilomètre carré pour 1953 seulement.

Les régions ont été délimitées en fonction des frontières actuelles *de facto* et tous les chiffres des années antérieures, revisés pour tenir compte des modifications territoriales, se rapportent à des superficies constantes. Les 13 régions sur lesquelles on a fourni des statistiques sont constituées de la façon suivante:

1. Afrique septentrionale: Afrique occidentale espagnole, Possessions espagnoles de l'Afrique du Nord, Maroc, Tanger, Algérie, Tunisie, Libye, Egypte, Soudan, Erythrée, Ethiopie, Somalies.
2. Afrique tropicale et méridionale: le reste de l'Afrique.
3. Amérique septentrionale: Alaska, Canada, Etats-Unis, Saint-Pierre-et-Miquelon, Groenland.
4. Amérique centrale: le reste de l'Amérique du Nord, y compris les Caraïbes.
5. Amérique du Sud: le continent entier.
6. Asie du Sud-Ouest: Turquie, Iran, Irak, Syrie, Liban, Israël, Jordanie, Chypre, la Péninsule arabique.
7. Asie du Sud (partie centrale): Afghanistan, Pakistan, Inde, Népal, Bhoutan, Ceylan, îles Maldives.
8. Asie du Sud-Est: Birmanie, Thaïlande, Indochine, Péninsule malaise, Philippines, Indonésie et les autres îles au sud du continent.
9. Asie de l'Est: le reste de l'Asie, à l'exception de la partie asiatique de l'URSS.
10. Europe du Nord et de l'Ouest: Pays scandinaves (y compris la Finlande et l'Islande), Royaume-Uni, République d'Irlande, îles Anglo-Normandies, île de Man, pays du Benelux, France.
11. Europe centrale: Allemagne, Sarre, Suisse, Autriche, Liechtenstein, Tchécoslovaquie, Pologne, Hongrie.
12. Europe méridionale: le reste de l'Europe, à l'exception de la partie européenne de l'URSS et de la Turquie d'Europe.
13. Océanie.

Estimations

Par suite de la quantité considérable de renseignements nouveaux fournis par les recensements de 1950-1951 et de l'accumulation d'informations de toutes sortes reçues depuis qu'ont été préparées en dernier lieu les estimations relatives à la période commençant en 1920 (voir le chapitre II de l'*Annuaire démographique 1949-50*), on a procédé à la révision de toutes les séries pour la publication des éditions 1952 et 1953 de l'*Annuaire*. Les estimations pour 1920, 1930 et 1940 ont été conservées dans le présent tableau tandis que celle relative à 1950 a été révisée à la suite de la réception de renseignements complémentaires depuis 1954. L'estimation relative à 1953 a été établie pour cette édition de l'*Annuaire*.

Etant donné l'incertitude des connaissances sur certaines parties de la population du monde, deux estimations ont été indiquées, ce qui permet de se rendre compte de l'intervalle dans lequel le chiffre exact de la population a de fortes probabilités d'être compris. A l'intention de ceux qui se serviront des données, on a également déterminé la médiane des intervalles de probabilité. La dispersion relative, au-dessus et au-dessous de la médiane, varie suivant les régions conformément aux évaluations soigneusement établies du degré d'exactitude des données de base, l'intervalle étant si petit pour l'Europe du Nord et de l'Ouest que lorsqu'on a arrondi les chiffres, l'un d'eux correspond exactement à la médiane. L'intervalle absolu de probabilité pour chaque total par continent et pour celui relatif au monde entier est, dans chacun des cas, inférieur à la différence entre la somme des estimations minima et celle des estimations maxima des parties constituantes, parce que l'on peut raisonnablement supposer que les erreurs d'estimations ont tendance à se compenser dans l'ensemble.

Dans la mesure du possible, en établissant les estimations qui figurent dans ce tableau on a laissé une marge pour tenir compte des lacunes de certains recensements. De ce fait, les totaux partiels régionaux et par continents ne correspondent pas toujours à ceux que l'on obtiendrait en additionnant les divers éléments constitutifs dans le tableau 1, bien que, à une exception près, les totaux partiels du tableau 1 soient compris dans l'intervalle indiqué au tableau 1A.

Superficie

Les superficies totales en kilomètres carrés par régions, continents et celle relative au monde entier ont été obtenues par addition des chiffres concernant les diffé rentes unités géographiques ou politiques qui figurent au tableau 1. En conséquence, ces superficies comprennent les eaux intérieures mais ne tiennent pas compte des régions polaires et de quelques petites îles désertes. Dans quelques cas, elles diffèrent légèrement de celles publiées précédemment à la suite soit de nouveaux calculs, de l'amélioration des estimations, ou de récupérations et gains de terrain.

Tableau 2

Le tableau 2 présente des estimations officielles de la population totale de 181 pays et territoires pour les années 1920 à 1954, à intervalles quinquennaux de 1920 à 1935 et pour chaque année de 1940 à 1954.

Période de référence

Sauf indication contraire, toutes les estimations se rapportent à la population présente (voir "Objet des données", à la page 49) au milieu de l'année civile (1er juillet). Lorsque les estimations officielles n'étaient dis-

ponibles qu'au 31 décembre, la moyenne arithmétique de deux estimations successives de fin d'année a été calculée et est présentée dans ce tableau comme une estimation au milieu de l'année. Dans certaines éditions précédentes de l'*Annuaire,* la discrimination entre les estimations au 1er juillet et celles résultant de moyennes de fin d'année ou de moyennes mensuelles ou trimestrielles était faite en note. Cette distinction n'a pas été maintenue dans le présent tableau, les différences en cause étant négligeables. Dans les quelques cas où les estimations officielles sont régulièrement établies à une date autre que le 1er juillet ou le 31 décembre, les chiffres officiels sont donnés dans le tableau avec une note précisant la date à laquelle ils se rapportent. Pour les années au sujet desquelles on disposait des résultats d'un dénombrement, on a parfois préféré à l'estimation au milieu de l'année le chiffre du recensement quelle que fût sa date, lorsque la concordance des deux données a paru insuffisante. Les chiffres de recensements ont également été publiés quand on n'a pu se procurer d'estimation correspondante pour l'année en cause. Les résultats de recensements sont en italiques dans le tableau pour permettre de les reconnaître aisément.

Estimations non révisées

Dans un certain nombre de cas pour lesquels les résultats des recensements de 1950, 1951 ou 1952 viennent à peine d'être connus ou ne sont que provisoires, les estimations établies entre deux recensements n'ont pas encore été révisées ni alignées sur les chiffres des derniers dénombrements. La nécessité d'une révision est évidente dans quelques-unes des séries; dans d'autres, seules des fluctuations secondaires sont impliquées par les données non révisées. Les séries affectées d'une irrégularité de ce genre sont marquées d'un paragraphe (§).

Tableau 3

Le tableau 3 présente des statistiques de la population de 60 pays et territoires répartie en groupes d'âge quinquennaux et par sexe. Contrairement au tableau correspondant de l'édition 1953 de l'*Annuaire* qui contenait toutes les répartitions de population par âge et par sexe résultant de recensements effectués en 1950, 1951 ou 1952 le tableau 3 ne renferme que des chiffres de recensements ou estimations non encore publiés dans l'*Annuaire.* Il constitue de ce fait un supplément de ce tableau et tous deux doivent être utilisés concurremment si l'on désire avoir une vue d'ensemble des résultats des recensements de 1950-51 par âge et par sexe.

Certains pays ou territoires pour lesquels les chiffres publiés dans l'édition précédente n'étaient que provisoires ou reposaient sur un sondage ont maintenant terminé le dépouillement de leur recensement. Ces chiffres provisoires ont par suite été remplacés par des chiffres définitifs dans ce volume. Sauf indication contraire, les données se rapportent à la population présente à l'intérieur des frontières des pays ou territoires considérés.

En principe, il convient d'admettre que les données se trouvant dans le tableau concernent des âges calculés en années révolues, c'est-à-dire, âge au dernier anniversaire. Néanmoins, les données relatives à la composition par âge et par sexe de la population souffrent de certaines insuffisances qui ont pour origine des lacunes dans le dénombrement des enfants de moins d'un an et des irrégularités dans les déclarations d'âges. Un aperçu de ces anomalies accompagné d'une description de la méthode employée pour évaluer la précision des statistiques de la population par âge et par sexe ont été donnée précédemment à la page 52. On trouvera une classification des répartitions par âge de populations d'après cette méthode dans le *Bulletin démographique*[5] ainsi que dans l'édition 1952 de l'*Annuaire démographique.*

Tableau 4

Le tableau 4 présente la population mariée (légalement ou religieusement) et les personnes en état d'union consensuelle, selon l'âge et le sexe. Les chiffres publiés sont ceux de deux ou trois recensements effectués depuis 1928. En plus les nombres absolus, le tableau indique la répartition pour cent de ces deux sortes d'états dans la population totale pour chaque groupe d'âge. Dans ce tableau le terme "marié" comprend les personnes qui ont déclaré être "mariées" ou "séparées" au moment du recensement et exclut les personnes "célibataires", "veuves", "divorcées", "en union consensuelle" et celles dont l'état matrimonial est inconnu. Cependant lorsque le groupe des personnes vivant en état d'union consensuelle n'a pas fait l'objet d'une classification spéciale lors du recensement, il est quelquefois compris avec les personnes "mariées". De tels cas sont signalés en note.

Insuffisances des données

La classification distincte des unions consensuelles ou "de droit commun" dans les pays où elles sont relativement nombreuses est important pour ce qui est de la comparabilité des données. Si des instructions spéciales au sujet de ce groupe n'ont pas été données pour le recensement, les personnes vivant en état d'union consensuelle seront signalées soit comme "mariées", soit comme "célibataires". Même lorsque des instructions précises sont fournies, il est difficile d'obtenir un contrôle total de ces individus, les inexactitudes dans les réponses au questionnaire de recensement constituant une source appréciable d'erreur. Il semble que les personnes en union consensuelle aient tendance à se déclarer "mariées" plutôt que "célibataires". Comme elles sont réellement mariées du point de vue démographique, la Commission de la Population des Nations Unies a recommandé qu'elles soient classées comme telles. Toutefois, quelques pays continuent à les classer avec les "célibataires" ce qui explique la proportion anormalement faible de la population figurant dans le groupe des "mariés" pour les trritoires en question.

De même, le groupe des personnes "séparées", à moins qu'il se limite à celles qui ont obtenu une séparation légale, est de composition incertaine et est susceptible de comprendre des personnes mariées vivant simplement à part et qui peuvent aussi bien avoir l'intention de demeurer séparées que celle de reprendre la vie commune. Mais, de toutes façons, comme les lois et coutumes relatives à la séparation légale varient d'un pays à l'autre et également à l'intérieur d'un même pays il est probable qu'un degré de comparabilité satisfaisant est hors de question pour ce groupe. Par suite des difficultés considérables qui empêchent d'obtenir des statistiques précises et comparables, les personnes séparées sont généralement comprises dans le groupe des "mariés". Certains pays considèrent

[5] *Ibid.*

plus pratique de distinguer deux sous-groupes, "mariés, époux présent", "mariés, époux absent" sans qu'on puisse dire pour cela que ces dernières données reflètent nécessairement une séparation définitive.

Comme dans le tableau 3, la classification selon l'âge se rapporte à l'âge au dernier anniversaire. Mais du fait que dans le tableau 4 les données portent sur un groupe d'âge plus élevé elles sont moins susceptibles d'être inférieures à la réalité (lacunes généralement plus fréquentes dans le dénombrement des enfants) quoiqu'elles n'échappent pas pour autant aux autres irrégularités dans les déclarations d'âge déjà mentionnées à la page 52. Des données sont présentées dans ce tableau pour 121 pays et territoires.

Tableau 5 et 6

Les tableaux 5 et 6 sont consacrés aux statistiques des femmes de 15 ans et plus respectivement classées suivant le nombre d'enfants nés vivants qu'elles ont déclaré avoir eus et d'après le nombre d'enfants encore vivants au moment du dénombrement. Ce sont là des chiffres de recensements et ils ne sont, par conséquent, disponibles qu'à la suite d'un dénombrement de la population.

Il conviendra de noter que le tableau 5 (enfants nés vivants) contient des données pour 65 pays et territoires alors que dans l'édition 1949-50 de l'*Annuaire* où il avait été publié pour la dernière fois il ne portait que sur 26 d'entre eux. Bien que des données sur ces caractéristiques ne soient pas recueillies dans tous les pays, cet agrandissement de la portée géographique du tableau indique qu'elles deviennent plus nombreuses avec le temps. Des renseignements sur la population féminine selon le nombre d'enfants vivants sont disponibles pour un nombre moins élevé de pays et territoires.

Dans ces tableaux, les âges sont répartis par groupes de 5 ans allant de 15 à 49 ans avec un groupe d'âge terminal de 50 ans et plus. Les nombres d'enfants indiqués sont 0, 1, 2, 3, 4, 5, 6 à 10, 11 et plus et "inconnu". Au point de vue de l'analyse démographique il eut été désirable d'avoir des groupes d'âge quinquennaux jusqu'à 75 ans et plus et des nombres d'enfants distincts de 1 à 9 et par groupes de 5 jusqu'à 20 et plus,[6] mais on n'a pu se procurer ces renseignements détaillés dans un nombre suffisant de cas pour qu'ils méritent d'être publiés.

En plus de la population féminine suivant le nombre d'enfants nés vivants et encore vivants les tableaux 5 et 6 indiquent le total (ensemble) des enfants déclarés dans chaque groupe d'âge et le rapport de ces enfants à 1 000 femmes (nombre d'enfants pour 1 000 femmes) de chaque groupe. Comme ces "totaux" ont été calculés en fonction des enfants déclarés seulement, on a dû supposer que le groupe "inconnu" correspond à 0 (enfants). Par suite les rapports (nombre d'enfants nés vivants ou encore vivants pour 1 000 femmes) ont été calculés à partir de toutes les femmes y compris celles dont le nombre d'enfants n'a pas été communiqué.

Insuffisances des données

La comparabilité de ces données sur le plan international est quelque peu réduite par des variations suivant les pays dans le groupe des femmes auxquelles se rapportent ces statistiques. Dans les tableaux, les statistiques sont relatives par définition à la population féminine de 15 ans et plus. Quelquefois, cependant, les données se rapportent à toutes les femmes mariées ou qui l'ont été. D'autres fois elles sont relatives aux "mères" (c'est-à-dire, aux femmes qui ont eu des enfants); dans d'autres cas encore, les données sont signalées comme concernant les femmes "mariées". Certaines de ces différences entrainent des disparités secondaires dans les données de base du fait que les "femmes mariées" peuvent ne déclarer que leurs enfants "légitimes" seulement. Il n'est pas impossible aussi que les mort-nés soient compris dans les chiffres communiqués. Ces variations sont indiquées en note dans les tableaux de même que celles relatives à la composition par âge.

Le nombre de femmes pour lesquelles le nombre d'enfants est inconnu varie également dans des proportions considérables. Comme on l'a déjà mentionné ces différences ont une influence marqué sur les rapports (nombre d'enfants pour 1 000 femmes) qui se trouvent dans la dernière colonne du tableau étant donné que l'on a supposé que le nombre d'enfants "non déclarés" est égal à 0. Par suite, à l'exception de rapprochements entre territoires où le groupe de femmes considérées est le même et où les "inconnus" (nombre d'enfants inconnu) sont peu importants, ces rapports ne peuvent être utilisés pour procéder à des comparaisons internationales valables des niveaux de fécondité. Ils peuvent toutefois se prêter à des parallèles de l'évolution à terme de la fécondité dans divers pays, ainsi qu'à des comparaisons des différences relatives entre les groupes d'âge.

Dans l'interprétation des données, il y a lieu de ne pas oublier que, dans certains pays, le nombre des enfants déclarés par les femmes appartenant aux groupes d'âges avancés est inférieur au chiffre réel. Les enfants mort-nés (dans les cas où ces naissances sont comprises dans les données) et les enfants qui meurent peu de temps après leur naissance risquent, en particulier, d'être négligés dans les déclarations. Ces omissions agissent en particulier sur le rapport entre le nombre d'enfants nés vivants et le nombre d'enfants encore vivants pour les pays où ces deux types de données sont recueillies. En fait, on peut considérer les écarts d'importance anormale comme le preuve d'omissions de ce genre.

Tableau 7

Une mesure fréquente de la fécondité, surtout lorsque les statistiques de l'état civil pertinentes et d'autres sortes de renseignements directs font défaut, est le rapport des enfants de moins de 5 ans à celui des femmes en âge de procréer. Le tableau 7 présente ces rapports pour 152 pays et territoires à partir de recensements effectués entre 1900 et 1952. Les rapports représentent le nombre d'enfants pour 1 000 femmes de 15 à 49 ans. En un sens, ces quotients constituent un perfectionnement des rapports relatifs aux âges de 15 ans et plus qui figurent dans le tableau 6. Les premiers, basés sur la déclaration par chaque femme de tous ses enfants encore vivants sont exprimés par rapport à 1 000 femmes de 15 ans et plus tandis que ceux du tableau 7 représentent le nombre d'enfants déclarés comme ayant moins de 5 ans au moment du recensement pour 1 000 femmes de 15 à 49 ans.

Insuffisances des données

Lorsqu'il s'agit d'interpréter ces rapports, on admet généralement comme hypothèse que les différences que

[6] Rapport de la Commission de la Population (quatrième session), Document E/1313, 21 avril 1949. Annexe 2, p. 22.

l'on relève d'un pays à l'autre reflètent des variations dans le rythme auquel les femmes en âge de procréer ont donné naissance à des enfants au cours des cinq années qui ont précédé le recensement. Cependant, d'autres facteurs agissent aussi de façon très sensible sur ces rapports. A cet égard ce sont les lacunes des recensements qui jouent le rôle le plus important. Comme on l'a signalé dans la section relative à la répartition par âge, il semble que, dans la plupart des recensements, la proportion des personnes non dénombrées soit plus forte chez les jeunes enfants que chez les personnes plus âgées. Le nombre de jeunes enfants indiqué dans les tableaux subit également l'influence des déclarations dans lesquelles l'âge du recensé est arrondi: certains enfants de moins de 5 ans peuvent être par erreur compris parmi ceux du groupe d'âge 5 ans et plus. Par conséquent, les rapports indiqués dans le tableau sont vraisemblablement un peu moins élevés qu'ils ne le seraient si les données de recensement relatives à l'âge étaient absolument exactes. Dans l'ensemble, l'erreur par défaut est probablement moindre pour les pays où ces rapports sont faibles, car dans bon nombre d'entre eux les statistiques sont de meilleure qualité que dans les pays pour lesquels ces rapports sont élevés. Toutefois, pour les régions où les habitants ignorent généralement leur âge, il est possible que ces rapports soient trop élevés. En tout état de cause, dans les pays où les données de recensement relatives à l'âge sont de mauvaise qualité (beaucoup de pays pour lesquels les rapports en question sont élevés appartiennent à cette catégorie), les différences qu'accusent les rapports, même si elles sont relativement importantes, peuvent être dues principalement ou entièrement à des lacunes dans les données de base.

Un autre facteur qui a une certaine influence sur les rapports du nombre d'enfants au nombre de femmes est la mortalité. Même si les données de base sont absolument exactes, les rapports ne correspondent pas nécessairement de façon rigoureuse à la cadence des naissances chez les femmes en âge de procréer au cours des années qui ont précédé le recensement. Les enfants de moins de 5 ans vivant à une date déterminée sont ceux qui ont survécu parmi les enfants nés au cours des cinq années précédentes. Par conséquent, les rapports impliquent invariablement une sous-évaluation du niveau réel de la fécondité. D'autre part, les taux de mortalité à ces âges varient sensiblement d'une partie du monde à une autre. Les régions de forte fécondité sont souvent aussi des régions de forte mortalité. L'importance des facteurs qui agissent sur les rapports en question est donc plus grande dans ces régions que dans celles où la fécondité et la mortalité sont faibles; d'autre part, si l'on compare ces deux catégories de pays, l'écart est moins grand pour ces rapports que pour la fréquence des naissances. Cependant, les rapports entre le nombre d'enfants et le nombre de femmes en âge de procréer sont plus utiles pour certains types d'études que les rapports entre le nombre de naissances et le nombre de femmes en âge de procréer. Si l'on veut étudier la cadence à laquelle une génération sera probablement remplacée par sa descendance, il n'y a pas lieu de tenir compte des enfants qui meurent en bas âge. A cet égard, les différences dans la mortalité infantile n'ont pas d'incidence sur la comparabilité des rapports indiqués.

STATISTIQUES DE L'ETAT CIVIL

EVALUATION DE LA QUALITE DES DONNEES

Faits d'état civil considérés — Enregistrement et transmission des données

Les statistiques de l'état civil qui sont présentées dans les tableaux 8 à 35 de l'*Annuaire démographique* ont été limitées à celles des naissances vivantes, des décès, des mort-nés (morts fœtales tardives), des mariages et des divorces. Cela correspond aux recommandations contenues dans le Principe 201 du document de l'Organisation des Nations Unies intitulé *Principes directeurs d'un système de statistiques de l'état civil*[7] qui comprend en outre dans les statistiques de l'état civil celles des morts fœtales précoces et intermédiaires, des adoptions, des légitimations, des reconnaissances, des annulations et des séparations légales. Les *Principes* auxquels on vient de faire allusion sont des recommandations pour l'amélioration et la normalisation des statistiques de l'état civil adoptées par la Commission de statistique à sa septième session en février 1953 et approuvées par le Conseil économique et social lors de sa quinzième session en avril 1953 dans la résolution [469 (XV) D] qui propose *inter alia* aux gouvernements "de procéder à un examen critique de leurs méthodes d'enregistrement des faits d'état civil et d'établissement des statistiques de l'état civil en tenant comptes des *Principes directeurs d'un système de statistiques de l'état civil,* et d'adopter toutes modifications possibles pour améliorer la qualité et la comparabilité internationale de leurs propres statistiques dans ce domaine".

Bien que les Nations Unies aient suggéré que pour l'enregistrement et la transmission des renseignements statistiques priorité soit donnée aux naissances vivantes, aux décès, aux morts fœtales, aux mariages et aux divorces, les statistiques qui s'y rapportent sont loin d'être disponibles dans la même mesure en partie à cause des différences de portée des législations nationales en ce domaine. Dans certains territoires l'enregistrement n'est pas obligatoire pour l'ensemble de ces cinq faits d'état civil; dans d'autres il ne l'est que pour une partie seulement de la population (c'est-à-dire population "européenne" ou "non indigène" de certaines régions d'Afrique). Pour d'autres pays, tels que l'Inde et le Pakistan, il n'existe pas de législation nationale qui prescrive l'enregistrement obligatoire, mais seulement des règlements ou décrets municipaux ou promulgués par les Etats qui ne portent pas sur l'ensemble du pays. Il en est encore autrement dans d'autres régions comme la Côte de l'Or où les autorités ont institué des "territoires d'enregistrement" comprenant seulement une partie du pays, le reste étant exclu parce qu'il est d'accès difficile ou parce qu'il est à peu près impossible, pour des raisons d'ordre économique et culturel, d'y procéder à un enregistrement régulier. En examinant les tableaux, on remarquera que l'enregistrement est particulièrement fragmentaire en Afrique, où il ne s'applique le plus souvent qu'à la population "européenne" tandis que la population indigène ne fait généralement l'objet que de quelques statistiques partielles. Pour une grande partie de

[7] Organisation des Nations Unies, Bureau de statistique des Nations Unies, *Principes directeurs d'un système de statistiques de l'état civil,* Etudes statistiques, Série M. No 19, New-York, août 1953, 28 pages.

l'Asie et pour certaines régions de l'Amérique latine, les statistiques issues de l'enregistrement sont incomplètes et de portée inégale.

Toutes ces variations dans l'application des dispositions législatives sur l'enregistrement obligatoire s'écartent de la recommandation des Nations Unies[8] sur le "Caractère obligatoire de l'enregistrement":

> *a*) Conformément à l'ordre de priorité exposé au principe 201, la loi devrait rendre obligatoire l'enregistrement des faits d'état civil survenant à l'intérieur des frontières du pays pour toutes les sections de la population; il faudrait également que d'autres dispositions assurent le respect de cette obligation.
>
> *b*) Chaque pays pourrait également prévoir des dispositions complémentaires n'ayant pas force obligatoire, en vue de l'enregistrement des faits d'état civil intéressant les nationaux qui séjournent temporairement à l'étranger.
>
> *c*) L'efficacité avec laquelle on pourra — ou l'on présume que l'on pourra — appliquer ces dispositions ne devrait pas être un facteur dont on tienne compte au moment de les arrêter.

L'expérience a montré que, en dépit des difficultés manifestes auquel se heurte l'enregistrement et bien que les données transmises soient souvent sujettes à caution, c'est seulement en commençant par rendre l'enregistrement obligatoire qu'une amélioration se dessine. L'enregistrement volontaire n'a jamais permis d'obtenir des données complètes.

Définition des faits d'état civil à des fins statistiques

Une autre source de variation, particulièrement dans les statistiques des naissances vivantes, des décès et des mort-nés provient de la définition qui a été adoptée de ces faits d'état civil à des fins statistiques. Avant 1950 la définition internationale[9] du "mort-né" était la suivante:

> Le produit est "mort-né" quand il y a naissance d'un fœtus viable (vingt-huit semaines) dans lequel la respiration pulmonaire ne s'établit pas, sa mort pouvant s'être produite: *a*) avant, *b*) pendant ou *c*) après l'accouchement, mais en tout cas avant qu'il ait respiré.

Il était nécessaire d'adopter un critère uniforme et précis pour différencier un mort-né d'autres produits de la gestation humaine qui n'ont pas encore atteint le stade de développement permettant de les classer avec les "mort-nés" afin d'assurer l'exactitude et la comparabilité des statistiques de la mortinatalité par opposition à celles des "avortements" ou des "fausses couches" comme on les désigne communément. Cependant au point de vue de l'exactitude et de la comparabilité des statistiques des naissances vivantes et des décès, il est encore plus important de fixer un critère précis et uniforme permettant de distinguer les mort-nés des naissances vivantes. Dans quelques pays, à savoir l'Espagne, Cuba, le Honduras, la Bolivie, l'Equateur et les possessions espagnoles de Ceuta et Melilla, il faut que le nouveau-né ait survécu vingt-quatre heures à sa naissance pour pouvoir être enregistré avec les naissances vivantes. Ainsi les nouveau-nés qui décèdent avant l'expiration de la période de vingt-quatre heures sont classés avec les "avortements" et par suite du manque de dispositions légales à cet égard, ne sont comptés ni parmi les statistiques de naissances vivantes ni parmi celles des décès. De même dans plusieurs contrées, les enfants nés vivants qui décèdent avant l'enregistrement de leur naissance, quel que soit leur âge au moment du décès, sont considérés comme "mort-nés" et ne figurent ni sur le registre des naissances vivantes, ni sur celui des décès. Il arrive encore que, dans d'autres régions, de tels cas sont enregistrés avec les "décès" et pas avec les naissances vivantes. Comme on l'a remarqué à propos des décès pendant les premières vingt-quatre heures de vie, à moins que des classifications spéciales n'aient été prévues, comme en Hollande par exemple, les statistiques des naissances vivantes et celles des décès sont déficitaires d'un nombre égal à celui de ces cas et le nombre de mort-nés accru d'autant. De ce fait les taux de mortinatalité sont supérieurs à la réalité et les taux bruts de natalité et de mortalité sont sous-évalués dans une certaine mesure. Cela influe aussi sur le taux de mortalité infantile car bien que les éléments constitutifs du taux accusent exactement en valeur absolue la même insuffisance, le taux tend à être sous-évalué parce que la sous-évaluation est proportionnellement plus grande par rapport au nombre d'enfants morts avant l'âge d'un an qu'elle ne l'est par rapport au nombre de naissances.

Un défaut de comparabilité attribuable à des différences dans les définitions adoptées existe également dans les statistiques des mariages et des divorces. Du fait que le mariage et le divorce sont des actes de caractère juridique plutôt que des événements biologiques ainsi qu'on le verra plus loin, la composition des statistiques transmises peut être une source de variation entre les pays. C'est ainsi que, dans certains d'entre eux, la statistique des mariages légaux se rapporte seulement aux cérémonies religieuses qui ont été célébrées; dans d'autres, elle n'a trait qu'aux mariages civils; dans d'autres enfin, les mariages civils et religieux sont tous deux considérés comme légaux. Dans tous les pays, les unions non enregistrées à l'état civil et connues généralement sous le nom de "consensuelles" "de droit commun" et "coutumières" sont exclues des statistiques mais il en résulte malgré tout un défaut de comparabilité des statistiques de la "formation des mariages" dans le sens démographique du mot parce que la proportion de telles unions varie grandement d'un pays à l'autre. Pour la même raison, il peut se faire que la population "mariable" et la population mariée, d'après lesquelles les taux spécifiques de nuptialité et de divorces sont calculés, ne soient pas comparables.

Recommandations sur le plan international

Les difficultés de comparaison provenant de cette source s'atténueront à mesure que les normes internationales de définition et de classification seront adoptées. Certains progrès dans la mise au point de normes internationales ont déjà été réalisés à la suite des travaux du Comité d'experts des statistiques sanitaires de l'Organisation Mondiale de la Santé qui a recommandé, en 1950, des définitions uniformes de la naissance vivante, de la mort foetale et du mort-né que les différents pays ont été invités

[8] *Principes directeurs d'un système de statistiques de l'état civil, op. cit. Principe* 203.

[9] Société des Nations, Comité d'hygiène, *Rapport de la Commission étudiant la définition de la mortinatalité,* C.M.1925.C.224.M.80, appendice 2, p. 76.

à adopter. De nouveaux progrès ont été faits dans cette voie et ont été étendus à d'autres faits d'état civil lorsque le Conseil économique et social des Nations Unies a approuvé les *Principes directeurs d'un système de statistiques de l'état civil*[10] L'un de ces Principes contient la définition normalisée, à des fins statistiques, de chacun des faits d'état civil au sujet desquels il est possible de recueillir des données par la méthode de l'enregistrement. Cette recommandation qui a pour but d'éliminer le défaut de comparabilité signalé précédemment est la suivante:

202. Définition, à des fins statistiques, de chacun des faits d'état civil au sujet desquels il est possible de recueillir des données par la méthode de l'enregistrement

a) La définition de chacun des faits au sujet desquels on recueille des données en vue d'établir des statistiques de l'état civil doit correspondre dans la mesure du possible à la définition donnée à des fins statistiques au paragraphe *c* ci-après.

b) Au cas où il serait impossible de concilier les définitions ou notions juridiques usitées dans un pays avec les définitions données ci-après, il y aurait lieu de prendre des dispositions pour faire les relevés statistiques d'après des définitions qui ne s'écartent pas, en leur principle, de celles qui figurent ci-après. S'il était impossible de prévoir des dispositions de ce genre, il faudrait donner une description exacte des divergences qui existent dans les publications où paraissent les statistiques de l'état civil.

c) Il est recommandé d'adopter, pour l'établissement des statistiques de l'état civil, les définitions suivantes:

1) La *naissance vivante* est l'expulsion ou l'extraction complète du corps de la mère, indépendamment de la durée de la gestation, d'un produit de la conception qui, après cette séparation, respire ou manifeste tout autre signe de vie, tel que battement du cœur, pulsation du cordon ombilical ou contraction effective d'un muscle soumis à l'action de la volonté, que le cordon ombilical ait été coupé ou non et que le placenta soit ou non demeuré attaché; tout produit d'une telle naissance est considéré comme "enfant né vivant".

Tous les enfants nés vivants devraient être enregistrés et comptés comme tels, quelle que soit la durée de la gestation, qu'ils soient morts ou vivants à l'époque de l'enregistrement; ceux d'entre eux qui décèdent à n'importe quel moment après la naissance devraient également être enregistrés et comptés comme "décédés".

2) Le *décès* est la disparition permanente de tout signe de vie à un moment quelconque, postérieur à la naissance vivante (cessation des fonctions vitales après la naissance sans possibilité de ressuscitation). Cette définition ne comprend donc pas les morts fœtales.

3) La *mort fœtale* est le décès d'un produit de la conception lorsque ce décès est survenu avant l'expulsion ou l'extraction complète du corps de la mère, indépendamment de la durée de la gestation; le décès est indiqué par le fait qu'après cette séparation le fœtus ne respire ni ne manifeste aucun autre signe de vie, tel que battement du cœur, pulsation du cordon ombilical ou contraction effective d'un muscle soumis à l'action de la volonté.

4) *Mortinatalité* est, par définition, synonyme de mort fœtale tardive, c'est-à-dire survenue au bout de la vingt-huitième semaine de gestation ou au-delà.

5) Le *mariage* est l'union légale de personnes de sexe différent. L'union peut être rendue légale par une procédure civile ou religieuse ou par toute autre procédure reconnue par la loi du pays; quelle que soit la procédure utilisée, tous les mariages devraient être déclarés aux fins d'établissement des statistiques de l'état civil.

6) Le *divorce* est la dissolution légale et définitive des liens du mariage, c'est-à-dire la séparation de l'époux et de l'épouse par décision judiciaire conférant aux parties le droit de se remarier civilement ou religieusement, ou les deux à la fois, conformément aux lois en vigueur dans chaque pays.

Les Principes comprennent également les définitions de "l'adoption", de la "légitimation", de la "reconnaissance", de "l'annulation" et de la "séparation légale", mais comme aucune statistique relative à ces faits ne figure dans l'*Annuaire*, les définitions n'ont pas été reproduites ici. Il est hors de doute que l'adoption progressive des définitions normalisées sera un excellent moyen d'éliminer les variations et différences déjà mentionnées que l'on trouve à présent dans les tableaux.

Degré de perfection des données

Code permettant d'évaluer la qualité des données

En dehors des variations produites par le manque d'uniformité qui existe dans les dispositions législatives nationales concernant l'enregistrement, il existe également des différences dans le degré d'efficacité de lois identiques appliquées dans divers pays. Les questionnaires au moyen desquels l'Organisation des Nations Unies obtient des bureaux de statistique nationaux les données publiées dans les tableaux ne se bornent pas à solliciter des statistiques mais contiennent également des demandes tendant à faire préciser l'exactitude et le caractère plus ou moins complet des données transmises. Sur la base des réponses à ces questions et à la suite de recherches effectuées dans les publications officielles autorisées, il a été possible de classer les statistiques de l'état civil des différents pays en trois grandes catégories: 1) celles retraçant de façon complète, ou presque, tous les événements relatifs à l'état civil (naissances, mariages, décès, etc.) survenus chaque année, indiqués par la lettre "C"; 2) celles signalées comme incomplètes ou susceptibles d'être affectées par des irrégularités importantes dans l'enregistrement, désignées par "U" et 3) celles au sujet desquelles il n'a pas été possible d'obtenir de renseignements, reconnaissables au symbole ". . .". Les résultats de cette classification sont reproduits dans la première colonne des tableaux 8, 9, 28, 31, 32 et 34 indiquant l'évolution à long terme du mouvement de la population et qui contiennent les nombres absolus de naissances vivantes, de décès de tous âges, de décès d'enfants de moins d'un an, de mariages et de divorces, ainsi que les taux bruts de natalité, de mortalité, de mortalité infantile et de nuptialité.

Application. — Bien que le code ne soit publié que dans les tableaux retraçant l'évolution à long terme du mouvement de la population, il est applicable aux statistiques de l'état civil des pays en cause partout où elles

[10] *Op. cit.*

figurent dans l'*Annuaire*. Par suite, en utilisant les données des tableaux 8 à 35, il convient de se reporter au code avant d'essayer de comparer ou d'analyser les statistiques, bien que, en ce qui concerne les valeurs des fonctions considérées dans les tables de mortalité (tableaux 36 à 38), on ait généralement déjà procédé aux ajustements imposés par les insuffisances des données de base. Le code permettant d'apprécier la qualité des données se rapporte aux statistiques de l'état civil mais pas aux chiffres de population pris comme base dans le calcul des taux. Cependant les deux éléments constitutifs du taux sont solidaires, surtout lorsque les statistiques de l'état civil ont été utilisées pour préparer les estimations de population. Il est possible d'évaluer avec plus de précision encore la qualité des taux en se reportant au code relatif aux estimations de population se trouvant dans le tableau 1.

Il ne faut pas perdre de vue que si, dans un grand nombre de cas, les statistiques conservent un degré élevé de précision pendant toute la période considérée, le code ne s'applique en permanence qu'aux données récentes. Pour les premières années la plupart des séries sont beaucoup plus sujettes à caution que le code le laisse entendre et, dans certains de ces cas, lorsque le pays en question a pu apprécier exactement la qualité de ses statistiques pour la période considérée, on a indiqué en note l'évaluation correspondante. De telles notes existent, entre autres, pour la République Dominicaine, le Mexique, Panama, la Pologne et la Yougoslavie.

On manque de renseignements sur la qualité des statistiques de l'état civil de nombreux pays et territoires, mais il est permis de supposer que pour la plupart d'entre eux la qualité des données fournies est assez douteuse. Le signe ". . ." dans la colonne réservée au code indique donc, en général, que les données auxquelles il s'applique doivent être considérées avec une certaine prudence. Un examen des taux calculés ou présumés pour ces territoires révélera aisément les cas dans lesquelles une présomption d'insuffisance est probablement justifiée. Toutefois, cette observation n'est valable que pour les territoires où les statistiques présentent des lacunes évidentes. Il ne faut pas oublier, en effet, que les connaissances sur les niveaux "présumés" de fécondité, mortalité et nuptialité relatifs à certaines régions du monde sont extrêmement sommaires et que les cas limites, qui sont les plus difficiles à évaluer, sont fréquents.

La comparabilité dans le temps est réduite au fur et à mesure que l'enregistrement des faits d'état civil devient plus complet au cours des années. Cette amélioration tend à masquer l'évolution réelle des naissances, des décès ou des mariages. Par exemple, une tendance constante à la hausse des taux bruts de natalité et de mortalité pendant la période à laquelle se rapportent les données présentées dans l'*Annuaire* a de fortes chances d'indiquer une amélioration de la portée des statistiques plutôt qu'une augmentation de la fécondité et de la mortalité. De même, l'élévation du taux de mortinatalité est plutôt un signe de progrès dans l'enregistrement. Par ailleurs, certaines mesures temporaires, comme la suppression des droit d'enregistrement pour encourager les déclarations, risquent de provoquer de brusques augmentations pour certaines années. Lorsque les statistiques comprennent les déclarations tardives, les fluctuations sont particulièrement marquées. Chaque fois que des facteurs de ce genre sont entrés en jeu, on l'a mentionné dans les tableaux. Comme le précisent les renseignements fournis dans les colonnes réservées au code et dans les notes, certaines des données présentées dans les tableaux sont utiles non pas parce qu'elles constituent une mesure des niveaux réels et des variations effectives, mais plutôt parce qu'elles désignent les pays où il existe un système d'enregistrement et qu'elles reflètent la mesure dans laquelle l'enregistrement des faits d'état civil devient plus complet.

Insuffisances. — La manière dont a été élaboré le classement qualitatif des données écartait la possibilité d'appliquer un critère objectif. Dans de nombreux cas, les éléments pris en considération par le pays intéressé pour apprécier ses propres données n'ont même pas été indiqués. Néanmoins, on a considéré qu'en de telles circonstances, les bureaux de statistiques nationaux étaient les mieux placés pour évaluer la qualité de leurs données et que même les larges catégories instituées à cet effet pourraient utilement renseigner sur la valeur des statistiques présentées dans l'*Annuaire*. Une appréciation plus objective de leurs statistiques par les différents gouvernements est expressément recommandée dans le Principe 106 ci-après du document déja cité[11] :

> *106. Appréciation de la valeur du système de statistiques de l'état civil*
>
> *a*) Pour compléter ces mesures de coordination, il faudrait désigner une autorité chargée de mettre au point et d'appliquer des méthodes permettant d'apprécier la valeur du système de statistiques de l'état civil.
>
> *b*) Les éléments d'appréciation seront plus ou moins détaillés selon le degré de développement du système, mais devraient comprendre, à un stade donné, des études approfondies ayant pour but de déterminer jusqu'à quel joint l'enregistrement et les statistiques des faits sont complets, ce qui permettrait d'apprécier l'exactitude quantitative des statistiques de l'état civil; on pourrait aussi juger dans quelle mesure les renseignements relatifs aux faits démographiques sont complets et exacts et essayer de déterminer jusqu'à quel point les programmes d'exploitation statistique des données de base répondent aux besoins des utilisateurs, notamment pour ce qui est de leur qualité, de leur caractère plus ou moins satisfaisant et de l'efficacité même du système.

On espère pouvoir enregistrer dans l'avenir de nouveaux progrès dans le sens d'une appréciation plus nuancée, plus uniforme et plus objective de ces données.

Méthodes d'exploitation des données

Population présente

Ainsi qu'on l'a indiqué précédemment et conformément à la partie *c* du Principe 409[12] du document déjà mentionné, les statistiques de l'état civil présentées dans l'*Annuaire* se rapportent à la population de fait ou population présente et les cas particuliers sont signalés en note. On ne s'est écarté de cette règle qui consiste à indiquer

[11] *Principes directeurs d'un système de statistiques de l'état civil. Op. cit.*

[12] *c*) En général, l'exploitation des données de base relatives au territoire national doit porter sur celles concernant des faits qui se sont produits à l'intérieur des frontières nationales; toutefois, dans certains cas, par exemple pendant la guerre, il peut être nécessaire de prévoir une exploitation des données sur les décès survenus aux armées en garnison hors du territoire national.

en note les cas qui ne correspondent pas à la définition générale, que dans les tableaux 28, 29 et 30 où la répartition des décès survenus parmi les forces armées est expliquée dans la mesure du possible, qu'elle constitue ou non une exception au principe de la population présente. En conséquence, sauf indication contraire, les tableaux des statistiques de l'état civil se rapportent à des faits qui sont survenus dans l'ensemble de la population comprise à l'intérieur des frontières des pays considérés.

On a reconnu la nécessité de faire une distinction entre les statistiques provenant de territoires où l'enregistrement est à peu près complet et ceux pour lesquels il est incomplet dans les Principes 402 et 403[13] qui recommandent l'établissement de "zones ou aires d'exploitation" (définies comme "territoire à l'intérieur duquel la portée de l'enregistrement et la précision des renseignements sont conformes à certains critères nationaux, c'est-à-dire celui sur lequel portent les opérations d'exploitation qui produisent les statistiques nationales") et d'exploitations distinctes pour certaines catégories importantes de la population à l'intérieur desquelles l'enregistrement des faits d'état civil est incomplet ou au sujet desquelles la quantité ou la qualité des données de base est très insuffisante. Conformément à ces *Principles,* les statistiques de certains pays ne comprennent pas les données relatives à une partie de la population pour laquelle l'enregistrement, bien qu'obligatoire, n'est pas suffisamment complet et les statistiques sujettes à caution. Parmi les pays qui procèdent de cette façon on peut citer, Panama et le Venezuela, où les statistiques de l'état civil ne comprennent pas celles des tribus indiennes; le Pérou dont la population de la jungle n'est pas comptée; la Guyane britannique, Surinam, Formose et l'Australie qui ne comprennent pas dans leurs chiffres les statistiques concernant les aborigènes. On a indiqué en note dans les tableaux tous les cas dans lesquels les statistiques ne portent que sur une partie du territoire national ou de la population du pays.

Exploitation des données d'après la date de l'événement

Autant que possible les données figurant dans les tableaux se rapportent à des événements survenus pendant l'année spécifiée plutôt qu'à ceux simplement enregistrés au cours de cette période. Cela correspond au Principe[14] ci-après du document déjà cité:

> *408. Exploitation d'après la date de l'événement ou d'après la date de l'enregistrement*
>
> *a*) L'exploitation principale des bulletins portant sur une période quelconque du calendrier de l'année civile doit s'effectuer d'après les faits survenus durant cette période (naissance, décès, mariage, etc.) et non ceux qui ont été seulement enregistrés pendant celle-ci. S'il s'avérait nécessaire, du point de vue administratif, d'exploiter les données définitives suivant la "date de l'enregistrement" plutôt que suivant la "date de l'événement", il y aurait lieu d'évaluer dans quelle mesure les résultats obtenus d'après la "date de l'enregistrement" coïncident avec ceux obtenus d'après la "date de l'événement" et il serait souhaitable d'indiquer le rapport existant entre ces deux classifications.

[13] *Principes directeurs d'un système de statistiques de l'état civil, op. cit.*
[14] *Ibid.*

Cependant, dans un nombre considérable de pays dont on trouvera la liste plus loin, les statistiques sont établies d'après la date de l'enregistrement, les déclarations tardives étant, dans ce cas, également comprises dans les statistiques relatives à l'année de l'enregistrement et non dans celles concernant l'année où les naissances, les décès, ou les mariages ont eu lieu. Lorsque, pour un même pays, le nombre de faits d'état civil enregistrés d'une année à l'autre varie énormément par suite de la mise en vigueur de mesures spéciales destinées à encourager l'enregistrement ou de la nécessité de posséder une preuve de la naissance ou du décès pour satisfaire certaines demandes, les statistiques de l'état civil établies d'après la date de l'enregistrement plutôt que d'après celle de l'événement sont de très mauvais indices du nombre de naissances, décès ou mariages qui se sont effectivement produits durant l'année spécifiée. De même lorsque le délai accordé ou écoulé, (ou les deux à la fois) entre l'événement et son enregistrement varie de façon notable, d'un pays à l'autre (comme c'est le cas) l'exploitation des données d'après la date de l'enregistrement produit des statistiques, qui ne sont pas toujours comparables avec celles d'autre régions ou territoires. Un examen des différences considérables entre pays dans le délai imparti pour l'enregistrement des faits d'état civil suffit à confirmer cette supposition d'autant plus qu'il est reconnu que les enregistrements ne sont pas tous effectués pendant la période accordée par la loi.

Le délai légal pour l'enregistrement courant des naissances vivantes varie d'un jour (vingt-quatre heures) dans certaines régions des Etats-Unis d'Amérique où la population est extrêmement dense, à soixante-deux jours en Nouvelle-Zélande et à quatre-vingt-dix jours dans certaines parties du Brésil éloignées d'un bureau de l'état civil. Les décès doivent être enregistrés dans un délai de vingt-quatre heures dans la plupart des pays, mais le temps accordé varie, atteignant trente jours dans la Nouvelle-Galles du Sud et le Queensland (Australie). L'enregistrement des mariages fait le plus souvent partie de la cérémonie, mais dans quelques cas, on a jusqu'à trente jours pour y procéder. Les divorces sont inscrits sur les registres du tribunal en cause dès qu'ils ont été prononcés mais dans certains pays une seconde inscription de l'arrêt doit être faite sur les registres de l'état civil, et un délai considérable peut s'écouler entre les deux enregistrements. Compte tenu des multiples facteurs entrant en ligne de compte, le *Principe* 212 suivant a été proposé par les Nations Unies[15] à cet égard:

> Le délai maximum entre le moment où se produit un fait d'état civil et son enregistrement obligatoire devrait être fixé en tenant compte de tous les facteurs qui jouent dans les pays; il devrait aussi être d'une durée propre à faciliter l'enregistrement rapide et exact de tous les faits pertinents.

Quelle que soit la longueur du délai accordé par la loi pour procéder à l'enregistrement, nul n'ignore que les déclarations tardives sont inévitables et que les satistiques des enregistrements courants comprennent souvent des faits qui se sont produits plusieurs années auparavant, en particulier dans les pays où le système de statistiques de l'état civil n'est pas encore très développé.

Symbole. — Par suite de l'importance de ce facteur et

[15] *Ibid.*

afin que ceux qui se serviront des données se rendent compte de la présence d'une source d'erreur en puissance dans les statistiques, les pays qui établissent leurs statistiques d'après la date de l'enregistrement sont indiqués par une croix (†). Des renseignements ne sont pas disponibles pour tous les pays et territoires représentés dans les tableaux, mais ceux sur lesquels on en possède se divisent en deux groupes, de la façon suivante:

Pays pour lesquels les données se rapportent à la date de l'événement

Albanie	Jamaïque
Allemagne Occidentale et Berlin	Japon
Angleterre et Pays de Galles	Jordanie
Autriche	Liechtenstein
Belgique	Luxembourg
Birmanie	Monaco
Bolivie	Norvège
Bulgarie	Pakistan
Canada	Panama
Corée du Sud	Pays-Bas
Danemark	Philippines
Espagne	Pologne
Etats-Unis	Portugal
Finlande	République Dominicaine
France	Roumanie
Hongrie	Saint-Marin
Iles Maldives	Sarre
Inde	Suède
Indonésie	Suisse
Iran	Taïwan
Islande	Tchécolosvaquie
Italie	Union Sud-Africaine
	Yougoslavie

Pays pour lesquels les données se rapportent à la date de l'événement

Argentine	Irlande (Rép.)
Australie	Israël
Ceylan	Liban
Chili	Mexique
Colombie	Nicaragua
Costa Rica	Nouvelle-Zélande
Cuba	Paraguay
Ecosse	Pérou
Egypte	Salvador
Equateur	Syrie
Grèce	Thaïlande
Guatemala	Uruguay
Honduras	Venezuela
Irlande du Nord	

En ce qui concerne les pays ou territoires qui ne figurent dans aucune de ces listes, il semble probable que, dans la plupart des cas, les données se rapportent à la date de l'enregistrement. Lorsqu'il s'agit d'un territoire non-autonome, il est à présumer que la procédure suivie dans le pays qui l'administre l'est également dans ses dépendances.

Comme il est indiqué au Principe 408[16], certains pays fournissent des données préliminaires fondées sur la date de l'enregistrement et des statistiques basées sur la date de l'événement. Lorsque l'enregistrement est rapide, l'écart entre les deux chiffres, pour une période donnée, est négligeable.

[16] *Ibid.*

Il convient de remarquer que, bien que ce facteur soit surtout important en ce qui concerne les statistiques des naissances pour lesquelles le délai d'enregistrement légal varie largement (et plus encore celui qui sépare effectivement l'événement de l'enregistrement), on trouve ce symbole (†) dans tous les tableaux présentant des statistiques de l'état civil à l'exception de celui relatif aux divorces. Cette distinction a moins de portée pour les statistiques des décès que pour celles des naissances car, ainsi que le prescrit le code sanitaire de la plupart des pays ceux-ci doivent être enregistrés rapidement afin d'obtenir un permis d'inhumer. Elle tire encore moins à conséquence pour les mariages dont l'enregistrement, dans de nombreux pays, fait partie de la cérémonie ou doit être effectué dans un délai assez court, Enfin ce facteur perd presque sa signification lorsqu'il est question de "mort-nés" parce que, dans ce cas également, un permis d'inhumer est nécessaire et aussi parce qu'il est assez peu probable qu'il existe des déclarations tardives à ce sujet.

DESCRIPTION DES TABLEAUX

Statistiques des naissances vivantes

Comme cette édition de l'*Annuaire* est consacrée aux statistiques de la natalité, un ensemble de 14 tableaux porte sur ce sujet en commençant par le tableau 8. Sauf indication contraire, les données se rapportent aux naissances vivantes, c'est-à-dire que les mort-nés et autres morts fœtales ne sont pas compris dans ces statistiques; les naissances illégitimes y figurent et, dans tous les cas d'accouchements multiples, chacun des enfants est compté séparément.

En général, les données présentées concernent les naissances vivantes survenues à l'intérieur des frontières actuelles du pays considéré et parmi la population présente. Par suite, on peut supposer qu'elles comprennent celles qui se sont produites parmi les tribus nomades, les aborigènes, les personnes déplacées, les réfugiés de guerre et les étrangers résidant dans le pays au moment de la naissance.

Insuffisances des données

On a déjà passé en revue les insuffisances des statistiques de l'état civil lorsqu'on a fait allusion au résultat des variations de la définition de chaque fait d'état civil à des fins statistiques, au code permettant d'apprécier la qualité des données, et aux conséquences de l'établissement des statistiques d'après la date de l'enregistrement plutôt que d'après celle de l'événement. Une source supplémentaire d'imperfection est particulière aux statistiques des naissances vivantes, c'est la tendance qu'ont tous les pays, quelle que soit leur définition du "mort-né", de ne pas porter sur les registres des naissances vivantes ceux des enfants qui, bien que nés vivants, décèdent avant l'enregistrement de leur naissance.

Dans la plupart des pays, l'officier de l'état civil est tenu par la loi de s'assurer que pour chaque enregistrement du décès d'un enfant de moins d'un an existe l'enregistrement correspondant d'une naissance vivante. Cependant cette disposition est quelquefois limitée dans son application comme, par exemple, au Chili où l'officier de l'état civil est obligé de vérifier l'enregistrement de la naissance, seulement si l'enfant dont le décès est déclaré a moins de trente jours. Le délai légal pour l'enregistre-

ment des naissances est de soixante jours au Chili. Mais dans tous les pays il existe indubitablement un certain relâchement dans l'application de la loi, particulièrement lorsque l'âge au décès est supérieur à un mois. De ce fait il est probable qu'on néglige toujours d'enregistrer un certain nombre de naissances vivantes dans presque tous les pays. Quelquefois, il arrive que les enfants décédès peu après leur naissance soient considérés comme "mort-nés" et enregistrés en tant que tels s'il existe un enregistrement des "mort-nés" et dans ce cas les statistiques des naissances vivantes et des décès sont incomplètes tandis que celles des mort-nés sont supérieures à la réalité. D'autres fois, ces naissances vivantes non enregistrées sont portées sur les registres des décès mais alors elles ne sont pas considérées comme des naissances. Il importe donc de ne pas oublier ces détails en utilisant les statistiques des naissance vivantes surtout s'il s'agit de celles relatives à des pays où le délai accordé pour faire la déclaration à l'état civil est relativement long.

Tableau 8

Dans ce tableau on trouvera le nombre des naissances vivantes déclarées dans 183 pays ou territoires. Comme on a fait dans cette édition de l'*Annuaire* une place spéciale aux statistiques de la natalité les données présentées ici portent sur le maximum d'années et de pays. On a publié des statistiques pour chaque année de 1938 à 1953. Les territoires importants sont représentés même si des données récentes font défaut pour eux. Les unités géographiques ou politiques plus petites pour lesquelles le nombre de naissances déclarées est faible figurent également dans le tableau afin de donner un cadre géographique aussi étendu que possible à l'évolution à long terme de la natalité. Pour la même raison les chiffres de naissances relatives à une partie seulement de la population ont été publiées lorsqu'on n'a pu se procurer de statistiques pour l'ensemble du pays.

Insuffisances des données

Outre les nombres de naissances vivantes dans 183 pays ou territoires le tableau 8 renferme un procédé d'évaluation de la qualité des données sous la forme de lettres conventionnelles "C" et "U" disposées dans la première colonne du tableau. Des explications détaillées sur les éléments de ce code et sa signification ont été fournies précédemment à la page 60. Une précision supplémentaire a été introduite cette année, il s'agit du degré d'enregistrement des naissances qui a été indiqué pour chaque pays ayant communiqué ce renseignement. Bien qu'ils ne soient pas nombreux, cette précision est donnée pour les pays suivants:

Alaska	92,1	pour	cent	en	1950
Canada	98	"	"	"	1941
Porto Rico	86,5	"	"	"	1940
Etats-Unis	97,9	"	"	"	1950
Argentine	97	"	"		
Sarawak	80	"	"		
Nicaragua	75	"	"		
Pérou	80	"	"		
Honduras	98,5	"	"		

Lorsque l'indice se rapporte à une année particulière il a été obtenu par évaluation du système d'enregistrement des naissances effectuée à l'occasion d'un recensement de population.

En utilisant les statistiques de ce tableau, il conviendra également de tenir compte des conséquences de l'exploitation des données d'après la date de l'enregistrement plutôt que d'après celle de l'événement. Les pays dans lesquels les statistiques sont établies d'après le date de l'enregistrement sont indiqués par une croix (†) dans le tableau. Quand le délai se prolonge entre l'événement et son enregistrement à l'état civil, c'est-à-dire lorsqu'une forte proportion des naissances vivantes fait l'objet de "déclarations tardives" comme c'est le cas dans certaines régions de l'Amérique du Sud, d'Asie et d'Afrique, l'établissement des statistiques d'après la date de l'enregistrement donne une idée très inexacte, si ce n'est complètement fausse, de l'évolution de la natalité.

Tableau 9

Les taux bruts de natalité, obtenus à partir des données du tableau 8, sont présentés dans le tableau 9. La portée géographique de ce tableau est quelque peu inférieure à celle du tableau correspondant renfermant les nombres absolus parce que, dans un certain nombre de cas, les estimations de la population indispensables au calcul des taux n'étaient pas disponibles. Dans d'autres cas le nombre de naissances en cause était trop faible pour constituer une base satisfaisante de calcul. Cette observation ne permet pas pour autant d'affirmer que tous les taux publiés sont parfaits. Les séries dans lesquelles un taux repose sur un effectif inférieur à 50 sont marquées d'un double astérisque (**).

Calcul des taux

Les taux bruts annuels représentent le nombre de naissances vivantes pour 1 000 personnes dans la population estimée au milieu de l'année ou, dans quelques cas seulement, dans la population à la date du recensement ou à une autre période de l'année. Les moyennes quinquennales des taux expriment la somme des naissances vivantes pendant la période considérée pour 1 000 personnes dans la somme des populations au milieu de l'année pendant la même période. En général, les populations à partir desquelles on a calculé les taux dans ce tableau sont représentées par les chiffres officiels qui figurent dans les tableaux 1 et 2. Si donc, les taux relatifs à certaines années ne sont pas indiqués dans le tableau alors que les nombres y figurent c'est que, la plupart du temps, on n'a pu se procurer d'estimations officielles de la population pour les années considérées. Par ailleurs, il peut se faire que des taux soient publiés pour des territoires qui ne se trouvent pas dans le tableau 2 lorsqu'ils se rapportent à une fraction de la population présentée dans ce tableau ou encore que les années au sujet desquelles les taux peuvent être indiqués sont seulement celles déjà mentionnées dans le tableau 1. Mais d'une manière générale, il suffit de se reporter aux tableaux 1 et 2 pour savoir ce que représente la population qui constitue le dénominateur des taux publiés dans le tableau 9.

Insuffisances des données

Les taux figurant dans ce tableau sont sujets aux mêmes limitations en ce qui concerne les données de base que celles qui ont été exposées précédemment dans les considération sur le tableau 8.

Abstraction faite de leurs insuffisances, les taux bruts

de natalité fournissent une mesure de l'augmentation brute de la population attribuable aux naissances, mais, comme la composition par âge et par sexe de la population varie d'un pays à l'autre, ces taux ne correspondent pas très exactement aux différences dans le nombre des naissances parmi la population en âge de procréer. Ils donnent simplement une idée générale des tendances dans le temps et des écarts existant entre les niveaux de natalité des divers pays.

Tableau 10

Le tableau 10 fournit la répartition des naissances vivantes suivant l'âge de la mère pour 84 pays et territoires. Les données se rapportent aux années 1936 à 1953. Les groupes d'âge indiqués sont "moins de 15 ans", quinquennaux jusqu'à 44 ans, "45 ans et plus" et "inconnu".

Insuffisances des données

Les données de ce tableau répondent aux classifications "C" ou "U" du code qui indiquent si elles sont virtuellement complètes ou si elles sont incomplètes. Des explications sur ce code ont été fournies à propos des statistiques de l'état civil en général et il figure dans le tableau 8. La comparabilité des données est également affectée par le fait qu'elles sont quelquefois exploitées d'après la date de l'événement et quelquefois d'après celle de l'enregistrement. Lorsque les statistiques présentées entrent dans ce dernier cas on l'a indiqué au moyen d'une croix (†) dans la colonne de gauche du tableau.

Il importe de garder à l'esprit également lorsqu'on utilisera ces données que certains pays calculent l'âge de la mère à la naissance de l'enfant (ou à l'enregistrement de cette naissance), c'est-à-dire à partir de la date exacte de l'événement (jour, mois et année) alors que d'autres ne prennent pour base que l'année seulement. On a indiqué en note ces différences de méthode lorsqu'on en a eu connaissance.

Comme ces statistiques sont classées par âge, elles sont affectées des mêmes limitations en ce qui concerne les déclarations d'âge que celles déjà exposées à propos de la répartition de la population selon l'âge et le sexe. Si aucun nombre ne figure dans la colonne réservée aux âges inconnus, cela ne signifie pas nécessairement que le rassemblement et l'exploitation des données par âge aient été tout à fait exact. C'est souvent une indication que l'on a attribué un âge aux "inconnus" avant la tabulation des données ou qu'ils ont été répartis proportionnellement entre les différents groupes après cette opération.

D'autre part lorsqu'il y a dans le tableau beaucoup de naissances au sujet desquelles l'âge de la mère est inconnu, il y a de grandes chances pour que l'on ait compté les naissances illégitimes dont les déclarations à l'état civil manquent généralement de détails.

Le défaut de comparabilité, à la fois entre les données de ce tableau et ces données et celles du tableau 8, est dû à un certain nombre de causes. Quelquefois, les données selon l'âge se rapportent aux accouchements plutôt qu'aux naissances vivantes ;en outre, dans certains cas les accouchements en question correspondent à ceux d'enfants nés vivants seulement tandis que, dans d'autres, ils concernent les accouchements soit d'enfants nés vivants, soit de mort-nés. Certains pays ne répartissent que les naissances légitimes par âge de la mère alors que les nombres relatifs aux naissances vivantes du tableau 8 se rapportent à toutes les naissances, légitimes ou non. Dans la plupart des cas cette restriction est peu importante, mais lorsque les naissances illégitimes sont relativement nombreuses, on ne peut considérer les données limitées aux seules naissances légitimes comme significatives. De même, dans d'autres pays, la répartition des naissances vivantes par âge de la mère ne porte que sur les enfants nés vivants qui ne sont pas décédés avant l'enregistrement de leur naissance tandis que les nombres du tableau 8 aussi bien que certaines données relatives à d'autres pays du tableau 10 comprennent ceux qui sont décédés avant l'enregistrement.

Tableau 11

Le tableau 11 présente les taux de natalité selon l'âge de la mère de 57 pays et territoires pour les années 1936 à 1953. Ces taux ont été obtenus à partir des nombres absolus de naissances vivantes qui se trouvent dans le tableau 10 et de la population féminine selon l'âge (chiffres de recensements ou estimations).

Portée

Par rapport au tableau 10, la portée géographique de ce tableau est sérieusement limitée et dépend de la mesure dans laquelle on a pu disposer de répartition de la population par âge et par sexe. Les naissances vivantes exploitées d'après l'âge de la mère, conformément aux recommandations des Nations Unies[17] sont disponibles dans le tableau 10 pour 84 pays et territoires, mais la population féminine selon l'âge ne l'est pas pour tous ces pays, ni également pour toutes les années de la série dans la plupart d'entre eux.

L'omission des pays et territoires pour lesquels les nombres dans la colonne relative aux âges inconnus représente plus de dix pour cent de l'ensemble des naissances vivantes constitue un autre facteur réduisant encore la portée géographique de ce tableau. On a également décidée de ne pas y inclure les séries reposant sur un nombre total de naissances inférieur à 50.

Calcul des taux

Pour calculer le taux selon l'âge, les naissances de mères d'âge inconnu ont été réparties proportionnellement parmi les naissances de mères d'âge connu[18] Ainsi, à l'exception du premier et du dernier groupe d'âge, les taux représentent le nombre de naissances vivantes attribuables aux mères classés dans un groupe d'âge spécifié (nombre rectifié par la répartition du groupe d'âge inconnu) pour 1 000 femmes du même groupe d'âge. Comme une infime fraction de l'ensemble des naissances se produit chez les femmes de moins de 10 ans et au-dessus de 50 ans, les naissances de mères de moins de 15 ans et de 45

[17] *Principes directeurs d'un système de statistiques de l'état civil, Op. cit.*, Principe 410e (5)

[18] Cette méthode de répartition des âges inconnus peut être critiquée dans une certaine mesure parce que l'on sait que la répartition selon l'âge de la mère pour les naissances légitimes diffère de celle pour les naissances illégitimes et que la proportion des "âges inconnus" est beaucoup plus forte dans le cas des naissances illégitimes. Il conviendrait de tenir compte de ce fait pour obtenir une répartition plus précise des naissances attribuables aux mères d'âge inconnu, mais ici encore la difficulté provient de ce que les naissances selon l'âge de la mère ne sont pas régulièrement classées en "légitimes" et "illégitimes" dans tous les pays.

ans et plus sont rapportées respectivement à la population féminine de 10 à 14 ans et de 45 à 49 ans. Le nombre de femmes d'âge inconnu n'entre pas en ligne de compte puisque le taux de natalité pour "tous les âges" indiqué dans ce tableau est en réalité un taux qui n'intéresse que certains âges et qui a été établi d'après le nombre d'enfants auxquels ont donné naissance les femmes de tous âges d'une part, et la population féminine entre 10 et 49 ans d'autre part. Les populations utilisées pour le calcul des taux par âge relatifs aux dernières années sont celles qui se trouvent dans le tableau 3 ou dans le tableau correspondant des éditions antérieures de l'*Annuaire*.

Insuffisances des données

Les taux figurant dans ce tableau sont sujets aux mêmes imperfections que celles affectant les nombres du tableau 10. La comparabilité dépend de la mesure dans laquelle les données de base sont complètes, de la procédure suivie pour calculer l'âge et de l'exploitation des données suivant la date de l'événement ou celle de l'enregistrement. On peut se rendre compte des conséquences de l'inclusion des déclarations tardives dans les statistiques des naissances selon l'âge de la mère en examinant les taux pour le Chili, le Pérou et Formose par exemple, où l'importance de ceux pour les âges de 45 ans et au-delà semble bien provenir de l'inscription de l'âge de la mère lors de l'enregistrement de la naissance plutôt qu'au moment même de la naissance de l'enfant.

Tableau 12

Des données sur les naissances vivantes légitimes selon l'âge de la mère sont présentées pour la première fois dans cette édition de l'*Annuaire démographique* pour les années 1936 à 1953. Comme il s'agit d'une classification plus "élaborée" que celle du tableau 10 le nombre de pays pour lesquels des statistiques sont disponibles est plus faible, à savoir 48 seulement.

Insuffisances des données

Les données de ce tableau étant similaires à celles du tableau 10, elles sont sujettes aux mêmes limitations que celles exposées à propos de ce dernier. La comparabilité dépend du degré d'enregistrement indiqué par le code se trouvant dans le tableau 8, des différences dans la méthode d'exploitation des données (signalées par la présence ou l'absence d'une croix (†) après le nom du pays dans le tableau), des variations dans le calcul de l'âge en années écoulées ainsi que de l'exactitude des déclarations d'âge.

Dans quelques cas, les données du tableau 12 sont relatives non pas exclusivement aux naissances vivantes légitimes mais aux naissances vivantes et mort-nés légitimes. Dans d'autres, il arrive qu'elles ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance; quelques fois encore elles peuvent se rapporter uniquement aux accouchements d'enfants légitimes nés vivants ou mort-nés ou aux deux à la fois. Il importe de ne pas perdre de vue ces variations en utilisant les données de ce tableau.

Tableau 13

Des taux de natalité suivant l'âge de la mère et la légitimité figurent pour la première fois dans l'*Annuaire démographique* au tableau 13.

Portée

Bien que ce tableau présente des taux pour 24 pays et territoires, sa portée géographique est encore plus réduite que celle du tableau 11 par le manque de populations de base. Non seulement la population servant de base au calcul des taux doit être classée en groupes d'âge correspondant à la répartition par âge des naissances vivantes légitimes, mais encore faut-il qu'elle le soit également suivant l'état matrimonial et le sexe. Il n'est possible d'obtenir de telles répartitions de la population qu'à la suite de recensements et, de ce fait, les années pour lesquelles on peut disposer de nombres absolus et de populations de base sont relativement peu nombreuses.

Comme pour les taux du tableau 11, on n'a pas calculé ceux-ci lorsque les naissances pour lesquelles l'âge de la mère est inconnu représentent plus de dix pour cent de l'ensemble des naissances légitimes, ni lorsque le nombre total de naissances légitimes était inférieur à 50.

Calcul des taux

Pour calculer les taux, les naissances de mères d'âge inconnu (à condition qu'elles soient inférieures à dix pour cent de l'ensemble des naissances) ont été réparties proportionnellement entre les naissances de mères d'âge connu. Les taux ont été calculés d'après la population féminine de 10 à 49 ans que l'on trouve au tableau 4. Les taux relatifs aux groupes d'âge représentent le nombre de naissances dans chaque groupe d'âge (y compris un certain nombre de naissances de mères d'âge inconnu) pour 1 000 femmes mariées de chaque groupe. Dans ce tableau le groupe des personnes "mariées" comprend celles qui sont séparées parce qu'elles n'ont pas perdu leur état matrimonial et exclut les personnes en "union consensuelle" car elles ne peuvent donner naissance à des enfants légitimes.

Conformément aux méthodes utilisées pour calculer les taux de natalité générale selon l'âge de la mère, les taux relatifs aux âges au-dessous de 15 ans ont été calculés d'après la population féminine de 10 à 14 ans, tandis que ceux relatifs aux âges de 45 ans et plus l'ont été à partir de la population féminine de 45 à 49 ans. La population d'âge inconnu n'entre pas dans les calculs.

Insuffisances des données

Les taux présentés dans le tableau 13 sont sujets aux mêmes limitations que celles qui affectent les données de base (renseignements plus ou moins complets, irrégularités dans les déclarations d'âge, différences dans les méthodes d'exploitation, etc.). Cependant, il faut remarquer qu'il s'agit là de taux suivant l'âge, le sexe et la légitimité qui sont plus représentatifs que ceux du tableau 11 et, pour cette raison, également beaucoup plus comparables entre eux.

Tableau 14

Le tableau 14 contient pour les années 1936 à 1953, les statistiques des naissances vivantes suivant l'âge du père. Ce tableau, qui avait été précédemment publié dans l'édition 1949-50 de l'*Annuaire*, a été considérablement augmenté bien qu'il comprenne moins de séries que le tableau correspondant "selon l'âge de la mère". Les

groupes d'âge sont "moins de 20 ans", quinquennaux jusqu'à 49 ans, "50 ans et plus" et "âge inconnu".

Portée

Par suite de la nature des données, les statistiques de ce tableau sont généralement limitées aux naissances vivantes légitimes. Lorsque des naissances vivantes illégitimes ont été incluses elles figurent pour la plupart dans le groupe des pères d'âge inconnu.

Insuffisances des données

La qualité et la comparabilité des données dépend des mêmes facteurs que ceux exposés à propos de la répartition des naissances vivantes suivant l'âge de la mère. Sept pays ne comptent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance ou 24 heures après qu'elle ait eu lieu; plusieurs autres tiennent compte indifféremment des naissances vivantes et de mort-nés. Les statistiques sont subordonnées à la mesure dans laquelle les données sont complètes, aux irrégularités dans les déclarations d'âge, aux variations dans le calcul de l'âge et également aux différences dans les méthodes d'exploitation (date de l'événement ou de l'enregistrement).

Tableau 15

Le tableau 15 présente des taux de natalité suivant l'âge du père, dérivés des données du tableau 14.

Portée

Du fait que pour calculer ces taux il convient de disposer de répartitions de la population par âge et par sexe, la portée géographique de ce tableau, comme celle des tableaux 11 et 13, est limitée par le manque de populations de base. Un autre facteur agissant dans le même sens est la faiblesse du nombre de naissances dans certains groupes d'âge lorsque les naissances vivantes sont réparties suivant l'âge du père. Les taux ne sont généralement pas calculés si le total des naissances considérées est inférieur à 50. Par suite 29 pays et territoires seulement sont représentés dans ce tableau alors que le tableau 14 en comprend 58.

Calcul des taux

On a calculé les taux dans ce tableau en faisant le rapport des naissances vivantes classées d'après l'âge du père à la population masculine répartie suivant les mêmes groupes d'âge. Les naissances de pères d'âge inconnu ont fait l'objet d'une répartition proportionnelle entre les groupes d'âge. Le taux "Tous âges" repose sur toutes les naissances mais a été calculé d'après la population masculine de 15 à 64 ans. Le taux pour "moins de 20 ans" repose sur les naissances de pères de moins de 20 ans mais a été calculé d'après la population masculine de 15 à 19 ans. De même, le taux terminal représente le rapport des naissances de pères de 50 ans et plus à la population masculine de 50 à 64 ans.

Insuffisances des données

En plus des facteurs négatifs déjà mentionnés à propos du tableau 14, une autre considération tend à limiter la comparabilité des séries de taux de natalité suivant l'âge du père. Du fait même que tant de séries de base se rapportent aux naissances légitimes seulement et que les taux sont calculés d'après la population masculine, ceux relatifs aux pays dans lesquels les naissances illégitimes sont nombreuses sont beaucoup plus faibles qu'ils devraient être en réalité. Une base plus indiquée pour les taux par âge dans de tels cas serait la population masculine mariée par âge et par sexe, ainsi qu'on l'a souligné à propos du tableau 13, mais cela réduirait de dix au moins le nombre des pays figurant dans le tableau.

Tableau 16

Ce tableau renferme des statistiques des naissances vivantes selon le rang de naissance pour les années 1936 à 1953. Le rang des naissance est calculé d'après le nombre d'enfants déjà nés vivants de la mère. Le tableau a été considérablement augmenté depuis sa dernière parution dans l'*Annuaire* et il contient à présent des données pour 61 pays et territoires. Les naissances vivantes de la première à la neuvième sont indiquées séparément; à partir de la dixième il n'y a plus qu'un seul groupe avec, en outre, une catégorie "inconnu" (rang de naissance inconnu).

Insuffisances des données

Comme on l'a déjà souligné au sujet des tableaux 10, 12 et 14, la comparabilité des données est limitée par des différences dans l'attitude adoptée dans chaque pays en ce qui concerne les naissances illégitimes, les naissances multiples et les mort-nés. Cependant, le facteur qui compromet le plus cette comparabilité est la méthode utilisée pour établir le rang de naissance.

La recommandation internationale insérée à ce sujet dans les *Principes directeurs d'un système de statistiques de l'état civil*[19] suggère que les naissances vivantes soient classées d'après l'âge de la mère et le rang de naissance parmi les enfants nés vivants, et que ce rang de naissance soit défini à cette fin comme "l'ordre numérique de l'enfant (dont le bulletin statistique de l'état civil relatif à la naissance est exploité), par rapport à tous les enfants antérieurement nés vivants de la mère, qu'il s'agisse d'enfants légitimes ou non". Beaucoup de pays suivent cette recommandation et classent les naissances vivantes d'après le nombre des naissances vivantes antérieures, mais d'autres calculent le "rang de naissance" à partir du "nombre de naissances vivantes antérieures plus les mort-nés"; d'autres encore utilisent comme base de calcul le nombre d'accouchements comprenant ou ne comprenant pas ceux de mort-nés. Dans certains pays, pour déterminer le rang de naissance on ne tient compte que des naissances vivantes légitimes antérieures ou des mort-nés, ou des deux à la fois, et, parfois même, que des naissances vivantes légitimes survenues pendant la durée du mariage en cours de la mère. Chaque fois que l'on a eu connaissance de ces limitations on les a signalées en note.

Les données de ce tableau ont ceci de commun avec celles des autres tableaux sur les naissances, qu'on peut évaluer la mesure dans laquelle elles sont plus ou moins complètes en se reportant au code qui fait partie du tableau 8. Il convient de remarquer cependant que, à moins que la série de données ne soit pas du tout représentative, les indications fournies par l'évolution des taux dans un même pays sont loin d'être dénuées de valeur.

[19] *Op. cit.*, Principe 410e (5).

Des renseignements sur le rang de naissance manquent le plus souvent pour les pays dans lesquels le délai qui s'écoule entre la naissance et son enregistrement est relativement long. Par suite, les répercussions de l'établissement des statistiques d'après la date de l'enregistrement plutôt que d'après celle de l'événement sont à peu près nulles dans ce tableau.

Tableau 17

Le tableau 17 présente les taux de natalité obtenus à partir des données du tableau 16. Les taux concernent les naissances vivantes et le rang de naissance a été calculé d'après le nombre d'enfants déjà nés vivants de la mère.

Portée

Le tableau 17 comprend moins de pays que le tableau 16 par suite de la nécéssité de disposer à la fois du numérateur (naissances) et du dénominateur (population par âge et par sexe) des taux. En outre, on n'a pas calculé de taux pour un certain nombre de territoires à cause de la faiblesse des chiffres des naissances après que celles-ci aient été réparties entre 10 groupes ou plus. Néanmoins, des données pour 37 pays et territoires sont publiées dans le tableau.

Calcul des taux

Les taux de ce tableau ne sont pas des taux spécifiques car ils ont été calculés à partir de la population féminine de 10 à 49 ans et non d'après les promotions de femmes par rang de naissance de leurs enfants nés vivants. Les naissances de rang inconnu n'ont pas fait l'objet d'une répartition proportionnelle entre celles de rang connu et les taux représentent le nombre de naissances vivantes de chaque rang pour 1 000 femmes de 10 à 49 ans.

Comme un grand nombre des séries présentées se rapportent aux naissances vivantes légitimes seulement, il aurait été plus indiqué de calculer les taux à partir de la population féminine mariée de 10 à 49 ans. Cependant, ainsi, qu'on l'a expliqué à propos du tableau 13, la nécessité de disposer alors d'une population de base répartie selon l'âge, le sexe et l'état matrimonial aurait notablement réduit la portée géographique du tableau.

Insuffisances des données

Les mêmes facteurs qui compromettent la comparabilité des nombres absolus dans le tableau 16 ont une influence identique sur les taux.

Quelques pays n'exploitent que les naissances vivantes légitimes, d'autres les accouchements d'enfants nés vivants ou encore ceux d'enfants nés vivants et mort-nés. Comme dans le tableau relatif aux nombres absolus, cependant, le principal obstacle à la comparabilité provient des variations dans le calcul du rang de naissance qui ont été exposées précédemment à propos du tableau 16.

En dépit de ces restrictions, des données de cette nature permettent l'étude de certains aspects de la fécondité en relation étroite avec la fréquence des mariages ou la dimension de la famille, les variations en cause se reflétant dans l'évolution de la répartition des naissances entre les divers rangs.

Tableau 18

Le tableau 18 est consacré aux naissances vivantes selon l'âge de la mère et le rang de naissance. Des statistiques y sont fournies pour 51 pays et territoires et le rang de naissance a été calculé d'après le nombre d'enfants déjà nés vivants de la mère. Ces données qui constituent un double classement des caractéristiques présentées dans les tableaux 10 et 16, ont naturellement une portée géographique moins grande que chacun d'eux.

Comme dans les tableaux 10 et 16 les groupes d'âge sont "moins de 15", quinquennaux jusqu'à 44 ans, "45 ans et plus" et "inconnu"; les naissances sont indiquées séparément jusqu'à la neuvième, à partir de la dixième il n'y a plus qu'un seul groupe et un groupe spécial pour les naissances de rang inconnu. Par suite, les totaux partiels, (naissances par rang, naissances par groupe d'âge) correspondent à ceux des tableaux déjà mentionnés (10 et 16), sauf indication contraire.

Insuffisances des données

Du fait que ces données constituent une combinaison de l'âge de la mère et du rang de naissance elles sont sujettes aux même limitations que celles qui s'appliquent aux tableaux 10 et 16. Leur comparabilité est compromise par des facteurs affectant la répartition par âge (enregistrement, déclarations, calcul), par ceux concernant la nature des données (accouchements, naissances vivantes, mort-nés et grossesses, légitimes et illégitimes) et également par ceux relatifs au calcul du rang de naissance. En outre, la comparabilité générale dépend de la mesure dans laquelle les données sont complètes (évaluée dans le tableau 8) et de la base d'exploitation choisie, c'est-à-dire, date de la naissance ou date de son enregistrement.

Afin de préciser les différentes sortes de données et les méthodes de calcul du rang de naissance, deux catégories de notes ont été employées, l'une indiquant la nature des statistiques, l'autre signalant les variations observées dans le calcul du rang des naissances. Il est essentiel de garder constamment à l'esprit les indications contenues dans ces notes en utilisant les données de ce tableau.

Tableau 19

Pour la première fois dans l'*Annuaire démographique* des taux de natalité selon le rang de naissance et l'âge de la mère sont publiés dans le tableau 19 pour 22 pays et les années 1948 à 1951. La portée géographique de ce tableau est limitée par un certain nombre de facteurs dont le principal est la possibilité de disposer de populations selon l'âge et le sexe qui puissent correspondent à une répartition des naissances par rang de naissance et âge de la mère.

Bien que des données pour les années 1942-1953 soient disponibles pour plusieurs pays, il n'a pas été possible de publier des taux pour toutes les années en question. On a décidé de présenter des taux pour les années 1948 et 1951 qui ont été considérées comme les plus représentatives et assez éloignées l'une de l'autre pour donner une idée de l'évolution en cause.

Calcul des taux

Les taux représentent le nombre de naissances vivantes de chaque rang pour 1 000 femmes dans chaque groupe d'âge. Les naissances de mères d'âge inconnu ont été répar-

ties proportionnellement entre les groupes d'âge (naissances de mères d'âge connu). Les naissances de rang inconnu n'ont pas fait l'objet d'une répartition. Ces taux sont donc similaires à ceux du tableau 11 mais ils se trouvent par surcroît classés selon le rang de naissance. Ainsi qu'on l'a remarqué à propos du tableau 17 des taux spécifiques par rang de naissance n'auraient pu être obtenus que pour les quelques rares pays qui exploitent les données sur la population féminine suivant l'âge et le nombre d'enfants nés vivants. Les répartitions de cette nature actuellement disponibles sont publiées dans le tableau 5. Bien qu'ils aient été calculés à partir de la population féminine totale dans chaque groupe d'âge considéré, les taux du tableau 19 permettent encore de se faire une idée assez exacte des caractéristiques et de l'évolution de la fécondité.

Insuffisances des données

Ainsi qu'on l'a mentionné à propos du tableau 18, les données classées selon l'âge et le rang de naissance voient leur comparabilité limitée par toutes les restrictions résultant de la façon dont sont faites les déclarations d'âge, du degré plus ou moins complet d'enregistrement des données de base, des variations dans les méthodes d'exploitation et de tabulation ainsi que des différences dans le calcul du rang de naissance. Il conviendra de tenir compte de ces réserves en utilisant les données du tableau 19.

Tableau 20

Dans le cadre de l'exploitation des données sur les naissances la durée du mariage a été définie dans les *Principes directeurs d'un système de statistiques de l'état civil*[20] des Nations Unies comme le nombre d'années entières écoulées entre la date exacte du mariage et celle de la naissance de l'enfant. C'est également la définition adoptée dans le tableau 20.

Dans ce tableau la durée du mariage est exprimée par les groupes suivants: moins d'un an, 1 an, 2 ans, 3 ans, 4 ans, 5 ans, 6 ans, 7 ans, 8 ans, 9 ans, 10 à 14 ans, 15 à 19 ans, 20 ans et plus et durée inconnue. La répartition pour cent des naissances suivant la durée du mariage a été calculée en faisant le rapport des naissances communiquées dans chaque groupe, y compris le groupe de durée inconnue, au nombre total de naissances pour l'année considérée.

Portée

On remarquera que les pays représentés dans ce tableau ne constituent qu'une faible partie de ceux du tableau 8 (nombres totaux de naissances vivantes) ce qui est une indication que dans la plupart des pays du monde, on n'exploite pas encore les données sur les naissances d'après la durée du mariage. Il convient toutefois de noter que la portée géographique de ce tableau est plus étendue que lors de sa dernière parution dans l'édition 1949-50 de l'*Annuaire* où il ne comprenait que 21 pays ou territoires.

Insuffisances des données

Comme toutes les statistiques des naissances vivantes celles-ci sont soumises aux mêmes restrictions en ce qui concerne le degré d'enregistrement et les méthodes d'exploitation que celles exposées à la page 60. De plus, leur comparabilité peut souffrir également des variations existant dans le calcul de la durée du mariage. Quoique, d'après les recommandations des Nations Unies cette durée doive être calculée en unités de temps écoulé entre deux dates exactes (jour, mois et année) elle est souvent le résultat d'une soustraction entre deux années seulement. Ce procédé occasionne généralement une erreur par excès dans les nombres relatifs à la durée du mariage à l'exception des cas où la durée est de moins d'un an ("moins de 1") qui sont certainement inférieurs à la réalité puisque toutes les naissances survenues dans les 12 mois qui suivent le mariage, mais durant l'années du calendrier postérieure à celle de sa célébration, sont comprises dans le groupe de "1 an". Les conséquences de ces variations dans le calcul de la durée du mariage apparaissent pleinement dans les statistiques relatives aux Pays-Bas pour l'année 1952. Cette année là, la durée du mariage a été calculée à l'aide des deux procédés déjà exposés, c'est-à-dire, d'après la date complète et d'après l'année seulement, ce qui a donné les résultats suivants:

	Temps écoulé entre les dates	*Temps écoulé entre les années seulement*
Total	230 686	230 686
Moins d'un an	32 084	10 775
1 an	27 359	35 606
2 ans	22 938	24 555
3 ans	21 091	21 463
4 ans	20 492	20 681
5 ans	20 161	20 570
6 ans	16 326	19 542
7 ans	8 486	12 170
8 ans	7 769	7 291
9 ans		8 167
10 à 14 ans	53 980	32 993
15 à 19 ans		13 011
20 ans et plus		3 724
Inconnue		138

Il convient également de ne pas oublier la tendance qui existe, en communiquant la durée du mariage, de ne prendre en considération que le dernier mariage sans qu'aucun compte ne soit tenu des mariages précédents.

Enfin, il ne faut pas perdre de vue aussi que ces données ne se rapportent qu'aux naissances légitimes. L'existence dans beaucoup de pays d'un grand nombre d'union consensuelles, qui ressemblent énormément à de véritables mariages sans être reconnues officiellement comme tels, signifie que de nombreuses naissances sont pour cela même considérées comme illégitimes et ne peuvent être comprises dans une répartition selon la durée du mariage. Les statistiques qui en résultent donnent par conséquent une idée erronée de la situation du point de vue démographique sinon du point de vue légal.

Tableau 21

Le tableau 21 contient des taux bruts et des taux nets de reproduction qui ont été communiqués par les services statistiques des divers pays ou empruntés à des publications officielles. On a publié dans certains cas, et avec l'approbation des autorités intéressées, des taux n'ayant aucun caractère officiel. L'établissement des taux de reproduction n'étant pas considéré dans plusieurs pays comme

[20] *Op. cit.*, Principe 309 (10).

une des tâches permanentes d'un service de statistique, ce tableau ne comprend pas tous les pays pour lesquels des statistiques disponibles permettraient de calculer ces taux.

Le taux brut de reproduction correspond à la somme des divers taux de fécondité par âge pour la population féminine. Ces taux sont obtenus en divisant le nombre de filles mises au monde en une année par les femmes d'un âge donné, par le chiffre de la population féminine ayant cet âge. Ils sont ensuite additionnés pour tous les âges. En conséquence, le taux est exprimé par rapport à "1 femme" et non pour "1 000 femmes" comme dans les autres tableaux du présent volume.

Le taux brut de reproduction permet de condenser, à des fins comparatives, les données relatives au taux de fécondité par âge qui ont été enregistrées en différents lieux et à diverses époques. Contrairement au taux brut de natalité, le taux brut de reproduction n'est pas influencé par la répartition par âge de la population.

De plus, le taux brut de reproduction a été souvent considéré comme exprimant la moyenne du nombre des filles mises au monde par les femmes au cours de leur existence. Si un certain nombre de femmes nées à la même époque devaient, à des âges divers, donner naissance au nombre de filles correspondant aux taux de fécondité sur lesquels se fondent les taux bruts de reproduction, les femmes encore vivantes à la fin de la période de fécondité auraient donné naissance, en moyenne, à un nombre de filles sensiblement égal à celui qu'indique le taux brut de reproduction. Cependant, cela ne serait tout à fait exact que si les femmes qui meurent ou émigrent avant d'avoir atteint la fin de la période de fécondité ne constituent pas un groupe à caractéristiques particulières.

Selon une autre interprétation, le taux brut de reproduction représente le nombre moyen de filles qu'auraient mises au monde un certain nombre de femmes de la même "promotion" dans une population où la mortalité serait nulle jusqu'à la fin de la période de fécondité (et où aucune émigration n'aurait lieu), et qui serait soumise aux conditions de fécondité considérées. Le taux brut de reproduction indique donc la limite extrême de l'accroissement de la population qui se produirait finalement si les taux de fécondité relatifs à une époque donnée étaient constants et si la mortalité des femmes de moins de 50 ans, par exemple, était nulle. Ainsi, pour une population ayant des taux de fécondité constants correspondant à un taux brut de reproduction égal à 0,8 le nombre des naissances subirait finalement une réduction de l'ordre de 20 pour 100 au cours d'une génération même si aucune femme ne mourait avant l'expiration de la période de fécondité. On entend ici par génération une période de temps sensiblement égale à l'âge moyen des mères à la naissance de leurs filles, dans une population stationnaire soumise aux condition de fécondité en question. Cette période est généralement de trente ans environ.

Les taux nets de reproduction ont été calculés en multipliant les taux de fécondité déterminés pour chaque groupe d'âge par la proportion de survivants qu'indique pour ces groupes d'âge la table de survie et en additionnant les chiffres obtenus. Il est possible, par analogie avec le taux brut, de considérer le taux net de reproduction comme indiquant le nombre moyen de filles que les femmes mettraient au monde au cours de leur existence si elles étaient soumises aux différents âges aux taux de fécondité et de mortalité ayant servi de base aux calculs. Il indique également le rythme maximum d'accroissement qu'accuseraient les naissances au cours d'une "génération" si les taux de fécondité et de mortalité sur lesquels les calculs sont fondés restaient constants.

En utilisant les taux bruts et les taux nets de reproduction pour analyser les répercussions sur le développement futur de la population des taux de fécondité et de mortalité observés, il ne faut pas perdre de vue que les taux de fécondité et de mortalité pour un âge déterminé, que l'on constate dans tel ou tel pays à une époque donnée, ne représentent pas les taux de fécondité et de mortalité d'une génération réelle de femmes et que, d'autre part, ils peuvent subir l'influence de facteurs qui sont essentiellement temporaires de nature. En outre, ces taux ne tiennent pas compte des taux de fécondité et de mortalité relatifs à la population masculine. D'autres indices dont l'utilisation se développera peut-être à l'avenir à la suite des conclusions récentes tirées des limitations de ces taux,—par exemple la mesure de la reproduction de la population masculine—n'ont encore été établis que pour un nombre très restreint de pays et de périodes. On accorde une attention de plus en plus grande à l'étude de l'évolution de la fécondité à partir des statistiques des naissances selon le rang et d'après la durée du mariage, statistiques analogues à celles qui figurent dans les tableaux 16 à 20 de ce volume.

L'exactitude des taux bruts de reproduction dépend évidemment de la précision du calcul des taux de fécondité par âge. Les principales sources d'erreurs sont les suivantes: 1) enregistrement incomplet des naissances; 2) fausses déclarations ou déclarations inexactes de l'âge de la mère au moment de l'enregistrement; 3) erreurs commises lors du dénombrement ou de l'estimation de la population féminine par groupes d'âge. Ces divers types d'erreurs sont examinés en détail dans d'autre parties de l'*Annuaire*.

Normalement les taux de reproduction sont calculés d'après les taux de fécondité se rapportant à des groupes d'âge quinquennaux, en tenant compte de toutes les naissances féminines et masculines. Cette méthode diffère quelque peu de celle qu'implique la définition des taux de reproduction donnée ci-dessus. Toutefois, l'utilisation de taux établis pour chaque année d'âge, d'après les naissances de filles seulement, donne des résultats qui ne sont pas sensiblement éloignées de ceux obtenus par les procédés habituels.

Les taux de fécondité par âge qui ont été calculés à partir des données contenues dans le présent *Annuaire* figurent au tableau 11. Il est possible que les taux bruts de reproduction obtenus à partir des taux de fécondité par âge qui figurent dans ce tableau ne soient pas exactement les mêmes que ceux qui sont indiqués au tableau 21, car il se peut que ces derniers reposent sur des estimations différentes de la population féminine ou que les naissances d'enfants pour lesquelles l'âge de la mère est inconnu aient été réparties d'une façon particulière. Il a pu se produire également que des ajustements aient été effectués pour compenser les lacunes de l'enregistrement ou d'autres disparités dans la méthode utilisée.

Certains des taux de reproduction qui figurent au tableau 21 ne constituent que des approximations. C'est le cas lorsque les données relatives au total des naissances étaient disponibles mais ne se trouvaient pas classées selon l'âge de la mère. La méthode la plus communément em-

ployée alors consiste à évaluer la répartition des naissances par âge de la mère à partir des taux de fécondité par âge observés à d'autres époques ou en d'autres lieux. Cette méthode de calcul fournit généralement un taux brut de reproduction dont la marge d'erreur ne dépasse pas 3 ou 4 pour cent.

L'exactitude des taux nets de reproduction dépend également de celle des tables de mortalité utilisées. Lorsque l'on calcule le taux net de reproduction il importe de bien déterminer la période couverte par la table de mortalité. En général, la table de mortalité utilisée est celle établie à partir des taux de mortalité féminine pour l'année à laquelle se rapportent les taux de fécondité; mais il arrive souvent que l'on choisisse des tables de mortalité relatives à d'autres années. Comme la valeur du taux net de reproduction est probablement plus sensible aux fluctuations des taux de fécondité qu'à celle des taux de mortalité, les taux nets de reproduction ainsi obtenus portent, lors de leur publication, la date à laquelle se rapportent les taux de fécondité. C'est cette méthode qui a été suivie dans le tableau 21. Lorsque les tables de mortalité se rapportent à une autre période que celle à laquelle ont trait les taux de fécondité, ce détail a été indiqué en note.

Statistiques de la mortinatalité (morts foetales tardives)

Les tableaux 22 à 27 présentent des statistiques de la mortinatalité. Comme les statistiques des naissances vivantes et des décès, ces séries se rapportent à la population présente à l'intérieur des frontières actuelles des unités politiques ou géographiques considérées.

Insuffisances des données

Degré de perfection des données. — L'enregistrement des mort-nés est encore plus fragmentaire que celui de n'importe quel autre fait d'état civil. Les régions connues pour avoir un système d'enregistrement imparfait ou irrégulier sont indiquées dans les tableaux 8 et 28, mais il faut admettre que de nombreux pays qui possèdent des statistiques relativement bonnes des naissances vivantes et des décès peuvent n'avoir que des statistiques tout à fait insuffisantes des mort-nés. Il est évident, d'autre part, que même dans le cadre d'un système particulièrement efficace, une proportion considérablement plus grande des mort-nés que des naissances vivantes ou des décès échappe à l'enregistrement. Mais il est difficile de mesurer ou d'estimer quelle fraction du total n'est pas enregistrée. Par suite, aucun renseignement précis sur l'étendue de la portée de ces statistiques n'a pu être obtenu, comme c'est le cas dans d'autres tableaux, et de ce fait on ne trouvera pas de code permettant d'apprécier la qualité des données dans ce tableau. Ce que l'on peut dire tout au plus c'est que dans les pays où la plupart des accouchements ont lieu avec l'assistance d'un médecin ou d'une sage-femme diplomée, l'enregistrement des statistiques de la mortinatalité est plus complet qu'ailleurs.

Définitions. — Comme on l'a indiqué précédemment la comparabilité des statistiques de la mortinatalité est fortement affectée par des différences de définition aussi bien que par des variations dans le degré d'enregistrement. On entend généralement par mort-né la naissance d'un fœtus viable, décédé à la naissance ou, en d'autres termes, une mort fœtale survenant assez tard au cours de la grossesse pour qu'il y ait eu jusque là une assez forte probabilité de survie. Ainsi qu'on l'a déjà mentionné, certains pays classent les enfants nés vivants décédés peu après leur naissance ("dans les vingt-quatre heures", "immédiatement après", "avant l'enregistrement de l'événement comme naissance vivante" etc.) avec les mort-nés. Les pays, relativement peu nombreux, connus pour suivre cette pratique sont notés dans les tableaux. En outre, quelques pays ne tiennent pas compte de la viabilité et classent tous les fœtus que l'on déclare nés sans vie avec les mort-nés.

Les critères de viabilité reposent d'ordinaire sur la durée de la grossesse calculée en jours, semaines ou mois. Les périodes minima de gestation indiquées varient largement, allant, d'après les renseignements qu'on a pu recueillir, de 3 à 7 mois. L'intervalle le plus fréquemment mentionné comme minimum est de 28 semaines. Quelques pays exigent en outre que le fœtus ait une longueur minimum, celle-ci variant entre 30 et 35 centimètres. Dans un certain nombre de cas la seule condition requise est que le fœtus soit viable et puisse être reconnu comme un "être humain".

Quoique des renseignements complets n'aient pu être obtenus sur la façon dont les mort-nés sont définis dans chaque région et pour toutes les années pour lesquelles des statistiques de la mortinatalité sont présentées dans ce volume, certaines précisions disponibles sur les pratiques en vigueur dans la plupart des pays considérés sont résumées ci-après. Cette classification est fondé sur le critère de "viabilité" seulement, c'est-à-dire qu'elle concerne les pays qui font une distinction entre les "mort-nés" et les "avortements". Les autres critères se trouvant à la base de la plupart des définitions du "morte-né" n'entrent pas en ligne de compte, à savoir, les "signes de vie" qui différencient les "mort-nés" des "naissances vivantes".

I. *Pays exigeant une période minimum de gestation:*

A. 28 semaines au moins

Bolivie
Brésil
Canada
Ceylan
Chili, depuis 1944
Costa-Rica
Côte de l'Or
Danemark
Equateur, depuis 1945
Fédération de Malaisie
Guatemala
Guinée Britannique
Honduras (ou 7 mois)
Honduras Britannique
Inde (quelques états)
Islande (6 mois ½ du calendrier)
Norvège
Nouvelle-Zélande
Paraguay
Pays-Bas, depuis 1950[21]
Pérou
Pologne (7 mois)
République Dominicaine
Roumanie (6 mois ½)
Royaume-Uni:
Angleterre et Pays de Galles
Ecosse
Salvador (ou 7 mois)
Thaïlande
Trinité et Tobago
Yougoslavie (ou 7 mois)
Zone du canal

[21] Les données figurant dans cet *Annuaire* sont classées selon la définition en vigueur avant 1950:26 semaines.

B. 26 semaines au moins

Belgique (plus de 180 jours)	Italie (6 mois)
Bulgarie (6 mois)	Ile Maurice (6 mois)
Colombie (6 mois)	Liechtenstein (6 mois)
Egypte (6 mois)	Luxembourg (6 mois)
Finlande (6 mois)	Pays-Bas, avant 1950
France (6 mois)	Trieste (6 mois)
	Venezuela (6 mois)

C. 20 semaines au moins (ou 5 mois, suivant l'indication)

Etats-Unis ("qu'il ait atteint la vingtième semaine" pour l'établissement des statistiques nationales)
Panama (5 mois)
Philippines (5 mois)

D. 3 mois au moins

Japon (plus de 3 mois)

II. *Pays exigeant seulement un poids ou une longueur minimum:*

Allemagne: République Fédérale (35 cm)	Suisse (plus de 30 cm)
Autriche (35 cm)	Tchécoslovaquie (plus de 400 g.)
Suède (35 cm)	

III. *Pays exigeant seulement que le fœtus soit viable ou qu'il puisse être reconnu comme un "être humain":*

Cuba (apparence)	Sud-Ouest Africain (viable)
Mexique (viable)	Union Sud-Africaine (viable)
Portugal (apparence)	
Rhodésie du Sud (apparence)	

IV. *Pays sans critère de viabilité:*

Angola	Inde Portugaise
Grèce	Maroc
Espagne	Mozambique
Iles du Cap-Vert	Saint-Thomas et île du Prince
Iles Anglo-Normandes	Zanzibar et Pemba
Inde (quelques Etats)	

Lorsque la période de gestation est exprimée en mois, il s'agit de mois lunaires et quelquefois de mois du calendrier de l'année civile. Il n'a pas été possible de déterminer exactement pour chaque cas quelle unité de calcul a été employée, mais dans la classification ci-dessus on suppose que les pays exigeant sept mois se réfèrent aux mois lunaires et par conséquent à vingt-huit semaines tandis que ceux pour lesquels six mois sont indiqués se basent sur des mois du calendrier de l'année civile équivalant d'ordinaire à 180 jours ou vingt-six semaines.

A cause de la diversité des définitions à partir desquelles sont établies les statistiques de la mortinatalité dans les différents pays et de la nécessité de posséder des données sur l'ensemble des pertes fœtales qu'il est impossible d'obtenir des définitions utilisées pour les mort-nés, le Comité d'experts des statistiques sanitaires de l'Organisation Mondiale de la Santé a étudié cette question lors de sa deuxième session en 1950 et a présenté certaines recommandations[22] pour examen par l'Assemblée Mondiale de la Santé. En premier lieu le Comité a proposé d'une part de définir le terme de "mort fœtale" plutôt que celui de "mort-né" et d'autre part il a suggéré que la définition de la mort fœtale soit l'inverse de celle de la naissance vivante. La définition de la mort fœtale qui a été adoptée d'abord par l'Assemblée Générale de la Santé, puis par le Conseil économique et social de l'Organisation des Nations Unies lorsqu'il a approuvé les *Principes directeurs d'un système de statistiques de l'état civil*[23] est la suivante:

> On entend par "mort fœtale" le décès d'un produit de conception, lorsque ce décès est survenu avant l'expulsion ou l'extraction complète du corps de la mère, indépendamment de la durée de la gestation; le décès est indiqué par le fait qu'après cette séparation, le fœtus ne respire ni ne manifeste aucun autre signe de vie, tel que battement du cœur, pulsation du cordon ombilical ou contraction effective d'un muscle soumis à l'action de la volonté.

Le Comité a présenté plusieurs autres propositions qui n'ont pas été adoptées par l'Assemblée mais qui ont été communiqués pour étude aux différents pays. Parmi ces recommandations on peut citer les suivantes:

> . . .
>
> *b*) L'établissement de tableaux statistiques de toutes les morts fœtales est un objectif souhaitable qu'il y aurait lieu d'atteindre le plus rapidement possible.
>
> *c*) Tous les pays devraient au moins procéder à l'enregistrement et à l'établissement de tableaux statistiques de toutes les morts fœtales survenues après la vingt-huitième semaine complète de gestation.
>
> *d*) Les tableaux statistiques des morts fœtales devraient comprendre les groupes suivants:
>
> Moins de 20 semaines complètes de gestation ..... Groupe I
> 20 semaines complètes de gestation mais moins de 28 semaines ..... Groupe II
> 28 semaines complètes de gestation et au-delà ..... Groupe III
> Durée de gestation ne pouvant être classée dans les groupes I, II et III Groupe IV
>
> (La durée de la gestation se compte à partir du début de la dernière menstruation)
>
> Les morts fœtales du groupe I pourraient également être désignées par l'expression "morts fœtales précoces".
>
> Les morts fœtales du groupe II pourraient également être désignées par l'expression "mort fœtales intermédiaires".
>
> Les morts fœtales du groupe III pourraient également être désignées par l'expression "morts fœtales tardives".
>
> . . .
>
> *g*) Le terme "mortinatalité", lorsqu'il est utilisé dans les statistiques d'un pays quelconque, devrait référer au groupe III (morts fœtales tardives).
>
> Il a été admis que le terme "mortinatalité" con-

[22] Organisation Mondiale de la Santé, Comité d'experts des statistiques sanitaires, Rapport sur la deuxième session, *Série des Rapports techniques No. 25*, Genève, octobre 1950.
[23] *Op. cit.*, Principe 202.

tinuerait nécessairement à être utilisé par de nombreux pays pendant quelque temps encore.

. . .

Jusqu'à présent, aucun pays n'a transmis de statistiques de toutes les morts fœtales, bien que l'on sache que 14 pays au moins ont adopté la nouvelle définition, dans son ensemble ou avec de légères modifications. Tant que les données communiquées par les pays ne répondront pas à la nouvelle définition et ne comprendront pas toutes les morts fœtales, le tableau correspondant de l'*Annuaire démographique* continuera à être consacré aux "morts fœtales tardives" ou "mort-nés".

Exploitation d'après la date de l'enregistrement. — On trouve à présent dans ces tableaux, le symbole (†), qui indique les territoires pour lesquels les statistiques des mort-nés ont été établies d'après la date de l'enregistrement. Pour les mort-nés, cette distinction n'est pas très importante en ce sens qu'ils sont en général enregistrés immédiatement après la naissance ou ne le sont pas du tout.

Tableau 22

Le tableau 22 retrace l'évolution à long terme de la mortinatalité et indique les nombres de mort-nés (morts fœtales tardives) pour 140 pays et territoires au cours de la période 1938-1953.

Insuffisances des données

Les observations et limitations dont il a été question précédemment sont également valables pour ce tableau. Comme il est impossible pour le moment d'évaluer les variations dans le degré d'enregistrement des mort-nés, les notes au bas de la page, jusqu'ici publiées à cet égard, ont été supprimées cette année et sont remplacées par une note explicative générale plus complète placée en tête du tableau.

Tableau 23

Le tableau 23 présente, pour les années 1936 à 1953, des taux annuels de mortinatalité dérivés des nombres absolus figurant dans le tableau 22.

Calcul des taux

Ces taux représentent la proportion de mort-nés pour 1 000 naissances vivantes, pendant la même période. Cette méthode de calcul a été adoptée par suite du caractère variable du degré d'enregistrement des mort-nés comparé à la stabilité relative de la déclaration des naissances, d'une année à l'autre. Tous les taux ont été calculés au Bureau de statistique des Nations Unies à partir des naissances vivantes qui se trouvent dans le tabeau 8, à l'exception de Ceylan pour qui on n'a pu se procurer les naissances vivantes de certaines années enregistrées dans la *"Proclaimed area"* alors que les taux officiels de mortinatalité étaient disponibles.

En général on n'a pas calculé de taux pour les territoires ayant des nombres inférieurs à 15 et les cas dans lesquels les taux reposent sur des nombres de 15 à 50 font l'objet d'une note et sont signalés par un double astérique (**). Ces notes qui indiquent qu'un ou deux taux d'une série ont été calculés sur moins de 50 mort-nés sont destinées à avertir le lecteur que ces taux sont sujets à caution et exposés à des variations accidentelles.

Insuffisances des données

Toutes les restrictions déjà exposées sont applicables aux taux de mortinatalité quoiqu'il soit quelquefois difficile de déterminer à partir des taux le degré d'enregistrement des mort-nés. L'enregistrement des mort-nés est fragmentaire dans la plupart des pays; mais lorsque cet enregistrement et celui des naissances sont tous deux incomplets, les taux qui en résultent peuvent être acceptables. En fait, dans les pays où l'enregistrement des naissances vivantes est le plus mauvais, il arrive que les taux soient plus élevés si bien que le caractère incomplet des données de base passe inaperçu. Cette influence relative du degré d'enregistrement des naissances vivantes ne doit pas être négligée si l'on veut se faire une idée exacte des taux de mortinatalité en cause.

En plus du rôle joué par le degré d'enregistrement des naissances vivantes, les statistiques de la mortalité peuvent être sérieusement affectées par des différences dans la méthode d'exploitation des données. Comme on vient de l'indiquer, les taux de mortinatalité sont calculés à partir des naissances vivantes, et le résultat peut être tout différent si elles ont été exploitées d'après la date de l'enregistrement. Lorsque le nombre annuel de naissances vivantes enregistrées et communiquées varie fortement par suite de l'introduction de nouvelles dispositions législatives ou de l'obligation de posséder une preuve de la naissance que doit remplir une partie importante de la population, les taux de mortinatalité varient également mais en sens contraire. En conséquence, il y a lieu d'utiliser avec une certaine prudence les données des pays où les statistiques se rapportent à la date de l'enregistrement à moins que l'on sache que le nombre de naissances vivantes d'après la date de l'enregistrement est très peu différent de celui obtenu selon la date de l'événement.

Tableau 24

Le tableau 24 renferme des statistiques des mort-nés selon l'âge de la mère. Ce tableau indique la répartition des mort-nés pour la période 1936-1953 d'après les groupes d'âge suivants: moins de 15 ans, groupes d'âge quinquennaux jusqu'à 44 ans, 45 ans et plus, âge inconnu.

Portée

Moins de pays figurent dans ce tableau que dans celui retraçant l'évolution à long terme de la mortinatalité parce que seulement un certain nombre d'entre eux exploitent les données sur les mort-nés d'après l'âge de la mère et aussi que les fréquences inférieures à 50 n'ont pas été publiées pour une répartition comportant tant de groupes que celle-ci.

Insuffisances des données

Toutes les observations relatives aux données qui ont été faites précédemment à la page 71 sont valables ici (limitations dues au caractère incomplet de l'enregistrement et manque de comparabilité dans les définitions). En outre, les statistiques des mort-nés classées selon l'âge de la mère sont sujettes aux irrégularitées et inexactitudes propres aux déclarations d'âge (voir p. 52) et aux différences dans les méthodes d'établissement de l'âge s'il est obtenu à partir de la date de naissance de la mère.

Tableau 25

Ce tableau qui complète le tableau 24 présente pour les années 1936 à 1953 des taux de mortinatalité selon l'âge de la mère pour 44 pays et territoires.

Portée

La portée géographique de ce tableau est limitée par les mêmes considérations que celles qui s'appliquent au tableau 24 et également par l'importance du nombre des mort-nés de mères d'âge inconnu. Lorsque ce nombre atteint ou dépasse 10 pour cent de l'ensemble on n'a pas utilisé la répartition pour calculer des taux selon l'âge de la mère par suite des conséquences défavorables de cette situation sur les divers groupes d'âge.

Calcul des taux

Les taux représentent le nombre de mort-nés dans chaque groupe d'âge. Avant de calculer les taux, les naissances vivantes de mères d'âge inconnu et les mort-nés dans la même catégorie ont été répartis proportionnellement entre les groupes d'âge connu. Comme on l'a déjà indiqué on n'a pas procédé à une telle répartition lorsque la proportion des "inconnus" atteint 10 pour cent de l'ensemble et dans ce cas les chiffres en question ne sont pas publiés dans le tableau.

Insuffisances des données

Les données du tableau 25 sont sujettes aux même restrictions que les nombres absolus du tableau 24; elles sont également affectées dans la même mesure par l'exploitation des naissances vivantes d'après la date de l'enregistrement. Les répercussions de cette pratique ont été mentionnées à la page 62.

Tableau 26

Un double classement des mort-nés selon l'âge de la mère et le rang de naissance est publié dans le tableau 26 pour 22 pays et territoires. A une exception près, ce tableau est identique au tableau 18 qui présente les naissances vivantes selon l'âge de la mère et le rang de naissance. Cette exception réside dans le rang de naissance. Celui relatif aux naissances vivantes a été calculé d'après les enfants déjà nés vivants de la mère. Au contraire, le rang de naissance utilisé pour les mort-nés tient compte de tous les enfants mis au monde par la mère, c'est-à-dire aussi bien de ceux nés vivants que des mort-nés. Ceci correspond à la recommandation contenue dans les *Principes directeurs d'un système de statistiques de l'état civil*[24] des Nations Unies, à cet égard.

Portée

Par suite de la complexité relative de ce classement et de la qualité douteuse des statistiques des mort-nés en général, la portée géographique de ce tableau est assez réduite, étant limitée essentiellement à des pays européens. Lorque le nombre total de mort-nés n'atteignait pas 50 aucun chiffre n'a été publié.

[24] *Op. cit.*, Principe 410e (20).

Insuffisances des données

Le défaut de comparabilité qui existe entre ces données peut provenir de causes très diverses: limitations propres aux statistiques de la mortinatalité en général, anomalies dans les répartitions par âge et plus encore différences dans la nature des données classées suivant ces caractéristiques, et méthode de calcul du rang de naissance. Pour un certain nombre de pays les données de ce tableau se rapportent aux mort-nés légitimes ou aux accouchements; pour d'autres, le rang de naissance repose sur les naissances légitimes seulement. Toutes ces variations ont fait l'objet d'une note dans les tableaux.

Tableau 27

On trouvera dans le tableau 27 des taux de mortinatalité selon l'âge de la mère et le rang de naissance. Le rang de naissance a été calculé d'après les naissances vivantes et mort-nés antérieurs. Ces taux ont été obtenus à partir des nombres absolus du tableau 26 (mort-nés) et du tableau 18 (naissances vivantes).

Portée

On a dû isoler, pour ce faire, des séries de mort-nés et de naissances vivantes correspondantes pour la même année qui aient été classés selon les mêmes groupes d'âge (âge de la mère) et d'après le même critère de rang de naissance (calculé à partir des naissances vivantes et des mort-nés). En premier lieu il a fallu s'assurer que les deux sortes de données en cause étaient de même nature: mort-nés et naissances vivantes; légitimes ou légitimés et illégitimes; ou accouchements sous leurs différentes formes. En suite on s'est soucié de la méthode suivie pour calculer le rang de naissance. En l'absence d'un rapport direct évident on a procédé par suppositions. Ainsi, lorsqu'on n'a pu déterminer la méthode de calcul du rang de naissance pour les mort-nés et que l'on savait d'autre part qu'il reposait pour les naissances vivantes sur "l'ensemble des naissances" (naissances vivantes et mort-nés antérieurs) on a admis par hypothèse que le rang de naissance s'appliquant aux mort-nés était également basé sur "l'ensemble des naissances". L'application de ces principles explique que seulement 17 pays et territoires, pour lesquels on a pu calculer des taux selon l'âge et le rang de naissance, figurent dans ce tableau.

Calcul des taux

Les mort-nés et naissances vivantes de mère dont l'âge n'est pas connu ont fait l'objet d'une répartition proportionnelle entre les autres groupes d'âge. Les taux pour les rangs de naissance inconnus n'ont pas été calculés. Les taux représentent le nombre de mort-nés de chaque rang et groupe d'âge pour 1 000 naissances vivantes dans le groupe d'âge et le rang de naissance correspondants.

Insuffisances des données

Les limitations des taux dans ce tableau, comme dans les autres relatifs à la mortinatalité, proviennent de variations dans le degré d'enregistrement, dans les définitions utilisées, dans les déclarations d'âge et l'exploitation des données selon l'âge, dans la nature des données de base et dans la méthode de calcul du rang de naissance. Toutefois, ces deux dernières restrictions ne s'appliquent pour ainsi dire pas ici étant donné la nécessité où l'on s'est

trouvé de ne retenir pour ce tableau que les pays où la nature des données de base et la méthode de calcul du rang de naissance sont identiques pour les mort-nés et les naissances vivantes.

Statistiques de la mortalité

Les tableaux 28 à 31 reproduisent des statistiques de la mortalité. Comme pour les naissances, ces données ne présentent pas toutes le même degré d'exactitude et ne sont pas toutes fondées sur un enregistrement complet.

Les données publiées correspondent aux décès survenus à l'intérieur des frontières actuelles du pays. Ces statistiques comprennent donc, à priori et sauf indication contraire, les décès qui se sont produits parmi les tribus nomades et les aborigènes, les forces armées étrangères ou nationales, les personnes déplacées et les réfugiés de guerre, ainsi que parmi les étrangers qui résident dans le pays au moment du décès. Elles n'englobent pas normalement les décès survenus dans les forces armées nationales ou chez les ressortissants civils nationaux qui se trouvent en dehors du territoire. Il y a lieu de souligner que l'absence de notes formulant des réserves à cet égard n'implique pas nécessairement que les données correspondent à la définition type. Cependant, des renseignements sont fournis dans presque tous les cas où des différences importantes sont en jeu.

Insuffisances des données

Les chiffres ne comprennent pas les mort-nés à l'exception d'un petit nombre de cas indiqués dans les tableaux où l'on a pu supposer à juste titre que le nombre de mort-nés en cause était trop faible pour fausser les statistiques. Les décès d'enfants nés vivants qui sont morts avant l'enregistrement de leur naissance ou dans les premières vingt-quatre heures ne sont pas compris dans les totaux de certains pays par suite de l'adoption de définitions des mort-nés et naissances vivantes ne s'y prêtant pas, comme on l'a déjà expliqué. Il s'agit là d'une exclusion importante puisque les décès qui surviennent dans un délai maximum de trois jours après la naissance risquent de ne pas être enregistrés, délai pendant lequel la mortalité a tendance à être élevée.

Du fait que les lacunes dans l'enregistrement des décès sont plus difficiles à déceler ou à évaluer que celles qui existent dans l'enregistrement des naissances, les colonnes réservées au code qui donne un aperçu de la qualité des statistiques dans les tableaux de mortalité à tous âges et de mortalité infantile (tableaux 28 et 31) contiennent plus "d'inconnues" que celles accompagnant les tableaux relatifs aux statistiques des naissances. On pense généralement que l'enregistrement des décès est plus complet que celui des naissances, mais cela peut ne pas être le cas partout. En fait, des exemples répétés démontrent que, dans plusieurs territoires et dans certaines conditions, les naissances peuvent être mieux enregistrées que les décès.

Les tableaux ont été soigneusement vérifiés et la plupart des disparités dans les chiffres ou dans les taux sont expliquées à l'aide de notes ou justifiées. Les différences qui n'ont pu être interprétées sont également indiquées en note, sauf lorsqu'elles sont très faibles et ne mettent en cause qu'un ou deux décès. Les écarts entre les taux provenant de l'emploi de chiffres de population à différentes dates de l'année (par exemple la population au milieu de l'année pour le tableau relatif au taux brut de mortalité et la population à la date du recensement pour le tableau concernant le taux de mortalité selon l'âge) ont été signalés. Ces variations sont très faibles, atteignant rarement une décimale.

Tableau 28

Ce tableau, présente les nombres annuels de décès pour les années 1946 à 1953 et les taux bruts de mortalité pour 1920 à 1939 et 1946 à 1953 (sous la forme de moyennes pondérées quinquennales de 1920 à 1939 et de taux annuels de 1946 à 1953). Sauf indication contraire, les données se rapportent aux décès survenus à l'intérieur des frontières actuelles des pays considérés et parmi la population présente. Il convient de remarquer toutefois que, dans ce tableau ainsi que dans le tableau 29, se trouvent un certain nombre de notes indiquant pour les années de guerre la répartition des décès dans les forces armées, nationales aussi bien qu'étrangères, et des pertes de guerre chez les civils. Ces précisions ont été données chaque fois qu'on a pu les recueillir même si la répartition en cause constitue une exception au critère de la population présente. On a procédé de la sorte par suite de la confusion qui entoure ce problème et de l'intérêt qu'on peut avoir à connaître la répartition des décès parmi les forces armées lorsque leur inclusion ou exclusion est susceptible de provoquer dans les taux bruts de mortalité des variations allant jusqu'à une décimale.

Portée

175 pays et territoires figurent dans le tableau 28. On n'a pas publié de statistiques pour les pays dont les nombres absolus étaient inférieurs à 15. Néanmoins la portée géographique représentée par ces pays est quelque peu trompeuse car, dans plusieurs cas, les statistiques reproduites se rapportent seulement à la partie non-indigène de la population. De ce fait, les données relatives à certaines régions, pour l'Afrique en particulier, ont une très faible valeur.

Calcul des taux

Les taux bruts annuels de mortalité qui figurent dans ce tableau représentent le nombre de décès signalés pendant l'année civile pour 1 000 personnes dans la population présente au milieu de l'année ou, quelquefois, à la date du recensement ou à une autre période de l'année. Les taux pour 1920 à 1939 sont des moyennes quinquennales pondérées. En général, les chiffres de population à partir desquels on a calculé les taux sont ceux publiés dans le tableau 2. De ce fait, en l'absence d'un chiffre officiel de population dans le tableau 2, on n'a pas indiqué de taux dans ce tableau, même si le nombre de décès pour l'année en question y figure. Il y a quelques exceptions à ce principe lorsque les taux se rapportent à une partie seulement de la population pour laquelle une estimation est publiée au tableau 2, ou quand les années au sujet desquelles on a pu présenter des taux sont seulement celles déjà mentionnées dans le tableau 1. Mais, d'une manière gnérale il suffit de se reporter aux tableaux 1 et 2 pour savoir ce que représente la population qui constitue le dénominateur des taux

que l'on trouve dans le tableau 28. Lorsque les taux reposent sur des données incomplètes, soit du point de vue géographique, soit du point de vue de la population, ou lorsqu'il n'y a pas correspondance exacte entre le numérateur et le dénominateur ces détails ont été également signalés en note chaque fois qu'il a été possible de le faire. On n'a pas indiqué de taux dans les cas où la portée des statistiques de la mortalité diffère considérablement de celle des statistiques de la population.

Insuffisances des données

Le code permettant d'apprécier la qualité des données, dont il a déjà été question, accompagne ce tableau mais il s'applique également aux tableaux 29, 30 et 31. Il y a lieu de tenir compte des indications de ce code au sujet duquel des explications sont fournies à la page 60 avant d'utiliser les données de ce tableau. De même, et bien que ce facteur ait beaucoup plus de valeur en ce qui concerne les naissances vivantes, on remarquera que, selon les pays, les statistiques sont établies d'après la date de l'événement ou d'après celle de son enregistrement; dans ce dernier cas, les données en cause sont indiquées par une croix (†) dans le tableau.

Tableau 29

Le tableau 29 contient les taux annuels de mortalité par âge et par sexe de 72 pays et territoires pour la période 1946-1953. A l'exception des deux premiers groupes d'âge, "moins d'un an" et "1 à 4 ans" et du dernier, "85 ans et plus", les taux se rapportent à des groupes d'âge quinquennaux. Lorsqu'on n'a pas suivi cette classification, mention en est faite dans le tableau.

Portée

En général, les données concernent la population présente ou population de fait des pays et territoires considérés. Chaque fois que les taux se rapportent à la population de droit, on l'a indiqué en note.

Calcul des taux

En calculant les taux de mortalité par âge et par sexe on n'a pas tenu compte des décès survenus à un âge inconnu ni de la population d'âge inconnu, sauf lorsque ces éléments entraient dans le taux de mortalité calculé pour tous les âges combinés. Par conséquent, chaque taux représente le nombre de décès survenus dans un groupe d'âge déterminé au cours d'une année pour 1 000 habitants dans le même groupe d'âge au milieu de l'année ou à une autre période de l'année. Il y a lieu de noter que, dans ce tableau, les taux pour le groupe de moins d'un an ne concordent pas avec les taux de mortalité infantile du tableau 31, lesquels sont établis d'après le nombre de naissances vivantes signalées pendant l'année plutôt que d'après celui d'enfants de moins d'un an au milieu de l'année. De même, les taux pour tous les âges sont différents dans plusieurs cas de ceux du tableau 28, car ces taux reposent sur les chiffres de la population totale à la date où sa composition par âge pour le calcul des taux selon l'âge était disponible. Il est fort possible que ce chiffre soit celui de la population à la date d'un recensement effectué dans l'année plutôt qu'au milieu de l'année ou qu'il soit différemment composé, comprenant ou ne comprenant pas par exemple certains groupes ethniques, les forces armées, etc. Quelquefois, la différence est attribuable au fait que les taux, dans ce tableau ont été calculés sur la population moyenne (obtenue en faisant la moyenne arithmétique des données par âge au mois de décembre de deux années consécutives) alors que les taux correspondants du tableau 28 reposent sur une estimation au 1er juillet. Les écarts de ce genre sont très faibles et n'ont pas été signalés dans le tableau.

Insuffisances des données

Etablir une correspondance précise entre les décès et la population en ce qui concerne l'inclusion ou l'exclusion des forces armées, des réfugiés, des personnes déplacées et autres groupes spéciaux, constitue un problème particulièrement difficile lorsqu'il s'agit des taux par âge. Dans les cas où il n'a pas été possible d'y parvenir, des notes indiquent les différences de portée des données de base. Les taux de mortalité pour le sexe masculin dans les groupes d'âge de 20 à 40 ans sont affectés par ce manque de correspondance et il y a lieu d'utiliser ces taux avec prudence lorsqu'on veut établir des comparaisons. On doit ajouter que même dans les cas où la population et les décès correspondent, la comparabilité des taux peut être faussée par des conditions anormales telles que l'absence du territoire d'un grand nombre de jeunes hommes sous les drapeaux. Le résultat est que les taux de mortalité paraissent élevés à ces âges, simplement parce qu'un grand nombre d'hommes valides de ce groupe d'âge, dont le taux de mortalité serait, dans des conditions normales, inférieur à la moyenne de celui des personnes de leur âge, a été écarté des calculs.

Tableau 30

Les statistiques des causes de décès, à la fois sous la forme de nombres absolus et de taux, sont présentées dans le tableau 30. Ce tableau contient des données pour une année au moins et pour le maximum de pays et territoires. Dans le cas où aucun renseignement nouveau n'était disponible, des chiffres déjà publiés l'ont été à nouveau. Cependant, dans la plupart des cas, les données sont récentes et figurent pour la première fois dans l'*Annuaire*.

Le tableau 30 est composé de deux parties A et B. La partie A indique les décès et les taux classés selon la "Liste abrégée" de la Cinquième révision (1938) de la Nomenclature internationale des causes de décès[25] tandis que la partie B est consacrée aux données disposées d'après la "Liste abrégée de 50 rubriques pour la mise en tableaux des causes de mortalité" de la Sixième révision (1948) intitulée "Classement statistique international des maladies, traumatismes et causes de décès"[26]. Cette présentation en deux parties était nécessaire du fait que la révision de 1948, contrairement aux révisions antérieures ne fournit pas un cadre de classification s'adaptant directement au précédent, à savoir celui de la révision de 1938, et, comme la nouvelle nomenclature

[25] *Nomenclatures internationales des causes de décès 1938 (Classification Bertillon)*, publié avec le concours du Ministère des Affaires étrangères de la République française par l'Institut International de Statistique, La Haye, 1940.

[26] *Manuel de classement statistique international des maladies, traumatismes et causes de décès*, Sixième révision des Nomenclatures internationales des maladies et causes de décès, adoptée en 1948, vol. 1, (Bulletin de l'Organisation Mondiale de la Santé, Supplément 1, Genève, Suisse, 1948).

a été adoptée pour être mise en application en 1950, il est encore trop tôt pour que chaque pays ait pu l'appliquer en établissant ses statistiques des causes de décès. Les deux parties se complètent en ce sens que les données pour 1947, 1948 et/ou 1949 sont généralement classées d'après la révision de 1938 et se trouvent dans la partie A, tandis que celles pour 1951, 1952 ou 1953 sont habituellement disposées dans l'ordre prescrit par la dernière révision et sont publiées dans la partie B. Dix-neuf pays sont représentés dans la partie A seulement; quatre figurent dans les deux parties du tableau et aucun ne se trouve uniquement dans la partie B.

Portée

Les pays et territoires qui figurent dans ce tableau ont été choisis parce qu'ils ont fourni des données classées selon l'une ou l'autre des deux révisions précitées et seulement dans la mesure où le total des décès attribués à la "sénilité" ou à des "causes inconnues ou mal définies" ne dépassait pas vingt-cinq pour cent de l'ensemble. Dans tous les autres cas et même si l'on savait que les données étaient défectueuses parce que la plupart du temps les certificats de décès n'avaient pas été établis par des médecins, on a néanmoins publié les statistiques des pays en cause dans le tableau.

Calcul des taux

Le taux pour chaque cause de décès est exprimé par rapport à 100 000 personnes dans la population totale estimée au milieu de l'année ou à une autre période de l'année. En conséquence, le taux pour toutes les causes combinées est la somme des taux relatifs à chacune d'elles et représente 100 fois le taux brut de mortalité du tableau 28 ou le taux de mortalité à tous âges qui figure dans le tableau 29.

Dans un ou deux cas on remarquera que le taux pour toutes les causes combinées ne concorde pas exactement avec le taux de mortalité correspondant du tableau 28. Cette disparité est due en majeure partie à des différences dans le nombre total de décès classés selon la cause qui peuvent provenir, à leur tour, d'omissions dans la transcription de certaines déclarations tardives ou de l'exclusion de la répartition des décès selon la cause d'enfants nés vivants décédés pendant les premières vingt-quatre heures ou avant l'enregistrement de leur naissance et qui ont été, par suite, enregistrés avec les "mort-nés" ou considérés comme "présentés sans vie". Dans certains pays, la méthode d'établissement des statistiques permet de différencier ces "pseudo mort-nés" des mort-nés véritables et de les ajouter au nombre total de décès mais il n'est pas possible de connaître la cause du décès du moment qu'elle n'est pas enregistrée.

Insuffisances des données

Malgré leur grande importance dans le domaine démographique et dans celui de la santé publique, les statistiques des causes de décès présentent malheureusement de nombreuses imperfections outre celles déjà mentionnées comme limitant la comparabilité internationale des statistiques des décès en général. Ces restrictions supplémentaires proviennent principalement de différences entre les pays en ce qui concerne la qualité, la disponibilité et l'efficacité des services médicaux ainsi que des disparités dans la procédure suivie pour l'établissement des certificats de décès. Il convient d'être très prudent lorsqu'on est en présence de répartitions dans lesquelles un nombre relativement élevé de décès est attribué à des causes "inconnues", "mal définies" ou "non spécifiées" ainsi qu'à la "sénilité". Dans de tels cas, les décès qui se sont produits dans des fractions importantes de la population peuvent n'avoir donné lieu à aucun diagnostic et il est alors probable que la répartition des causes connues est loin de donner une vue exacte de la situation d'ensemble. On n'a pas signalé en note ces répartitions auxquelles on ne peut trop se fier mais il importe d'interpréter avec beaucoup de circonspection les taux relatifs aux causes de décès se rapportant à des territoires dans lesquels une grande partie des décès sont attribués à la "sénilité" ou des "causes inconnues". En gardant ce détail à l'esprit lorsqu'on étudie la répartition des causes et en utilisant le code permettant d'apprécier d'une manière générale la qualité des données qui accompagne le tableau 28 on doit pouvoir se faire une idée suffisamment juste de la valeur des statistiques des causes de décès. Un examen plus détaillé des problèmes posés par l'interprétation de ces statistiques a été fait au chapitre II de *l'Annuaire démographique 1951.*

Tableau 31

Le tableau 31 renferme des statistiques de la mortalité infantile (décès d'enfants de moins d'un an) pour la période 1920-1953. Comme le tableau 28 celui-ci présente les nombres annuels de décès au-dessous d'un an pour 1946 à 1953 et les taux de mortalité infantile sous la forme de moyennes pondérées quinquennales de 1920 à 1939 et de taux annuels de 1940 à 1952.

Portée

Les données se rapportent à la population présente de 158 pays et territoires importants qui ont fourni des statistiques récentes sur la mortalité infantile. Comme les taux de mortalité infantile sont calculés à partir du nombre de naissances vivantes la mesure dans laquelle les chiffres de population de base sont disponibles n'est pas un facteur susceptible de limiter la portée de ce tableau.

Calcul des taux

Calculés suivant la méthode classique, les taux de mortalité infantile publiés dans ce tableau représentent le nombre de décès d'enfants de moins d' un an pour 1 000 naissances vivantes survenues pendant la même période. Cela signifie que l'on n'a pas tenu compte du fait que certains des décès qui se sont produits pendant une année sont ceux d'enfants nés au cours de l'année précédente. Toutefois, l'erreur n'est pas très importante, à moins que les nombres des naissances vivantes ou de décès d'enfants de moins d'un an ne varient rapidement.[27]

Insuffisances des données

La limitation la plus importante et la plus répandue apportée à la comparabilité des taux de mortalité infantile provient de l'établissement des statistiques des décès

[27] Pour un exposé plus complet de ce problème, voir *Foetal, Infant and Early Childhood Mortality,* Organization des Nations Unies, Département des questions sociales, Division de la population, document ST/SOA/Série A. Etudes démographiques No 13, New-York, vol. I, chap. II.

d'enfants de moins d'un an et des naissances vivantes d'après la date de l'enregistrement, quelle que soit celle à laquelle l'événement s'est produit. Lorsque cette pratique a pour effet d'augmenter fortement le nombre des naissances enregistrées pendant une année donnée, quelle que soit la raison de cet accroissement, elle peut introduire des erreurs considérables dans les taux de mortalité infantile, à plus forte raison du fait que les décès ont tendance à être déclarés plus rapidement que les naissances. Si le délai d'enregistrement reste presque constant et s'il est à peu près le même pour les naissances et pour les décès, les taux ne sont pas affectés dans des proportions appréciables par ce facteur. Mais si une grande partie des naissances ne sont enregistrées qu'après plusieurs années, comme c'est le cas dans beaucoup de pays, les taux de mortalité infantile obtenus en effectuant le rapport entre le nombre de décès d'enfants de moins d'un an survenus durant une année et celui des naissances qui se sont produites au cours de plusieurs années n'ont aucune valeur. Par suite de l'importance de ce facteur, en particulier pour ce qui est des naissances vivantes qui constituent le dénominateur des taux de mortalité infantile, on a indiqué par une croix (†) les statistiques établies d'après la date de l'enregistrement.

Même lorsque les statistiques se rapportent à la date de l'événement, des lacunes dans l'enregistrement des naissances et des décès d'enfants de moins d'un an affectent les taux à moins que la proportion des faits enregistrés ne soit la même pour le numérateur et pour le dénominateur. Afin d'éclairer l'utilisateur sur le caractère plus au moins complet des données les symboles "C" ou "U" du code expliqué en détail à la page 60 ont été employés dans ce tableau. Ce code qui figure dans le tableau 28 relatif aux décès à tous âges, précise plus particulièrement ici la mesure plus ou moins complète dans laquelle les décès d'enfants de moins d'un an ont été enregistrés et communiqués. Les différences dans la proportion enregistrée des éléments constitutifs du taux de mortalité infantile, c'est-à-dire les décès d'enfants de moins d'un an et les naissances vivantes, introduisent des erreurs par excès ou par défaut, le sens de l'erreur étant déterminé par celui des deux éléments, (numérateur ou dénominateur) pour lequel l'enregistrement est le plus complet.

Ce caractère plus ou moins complet de l'enregistrement des naissances vivantes et des décès d'enfants de moins d'un an dépend également de la définition à des fins statistiques des événements à déclarer. Ainsi qu'on l'a déjà indiqué à la page 59, le fait de n'inscrire ni dans le registre des naissances ni dans celui des décès les enfants nés vivants décédés dans les premières 24 heures ou avant l'enregistrement de leur naissance, peut fausser les statistiques dans une certaine mesure, le taux accusant alors une erreur par défaut. Ne pas enregistrer en tant que naissances vivantes les nouveau-nés qui décèdent pendant les premières semaines de vie contribue également à créer un défaut de comparabilité entre les taux de mortalité infantile, mais les conséquences dans ce cas, si elles sont sensibles, tendraient à provoquer une erreur par excès.

Statistiques de la nuptialité

Les tableaux 32 et 33 présentent des statistiques relatives aux mariages. Conformément aux recommandations contenues à ce sujet dans les *Principes directeurs d'un système de statistiques de l'état civil,*[28] les statistiques se rapportent, sauf indication contraire, aux mariages officiels, c'est-à-dire à l'union légale de deux personnes de sexe différent sanctionnée par une cérémonie civile ou religieuse suivant la loi en vigueur dans chaque pays. Dans la mesure du possible, les données contenues dans les tableaux concernent à la fois les mariages civils et religieux (si tous les deux sont reconnus par la loi) et représentent le nombre de mariages célébrés au cours de l'année spécifiée, plutôt que celui des mariages enregistrés pendant cette même année.

Les données figurant dans ces deux tableaux se rapportent aux mariages célébrés à l'intérieur des frontières actuelles des pays considérés et, sauf indication contraire, dans la population présente. Cependant, en raison de la notion juridique sur laquelle reposent ces données, les mariages parmi les tribus ou les groupes indigènes isolés des formes de civilisation actuelle sont presque toujours exclus des statistiques. Ces cas ont néanmoins fait l'objet d'une note dans le tableau ainsi d'ailleurs que toute autre déviation du concept de la population présente.

Insuffisances des données

Le mariage étant un acte juridique et non un fait biologique comme la naissance et le décès, le problème de la comparabilité se présente sous un aspect quelque peu différent pour ce genre de données.

Définitions. — En raison des conséquences que pourrait avoir leur inclusion dans la définition du mariage à des fins statistiques et par suite de leur nature même, les unions consensuelles ne font pas partie de cette définition et sont exclues de ce fait des statistiques, sauf si des mesures spéciales tendant à les légaliser les font entrer dans la catégorie des mariages légaux. Dans certains pays, ces unions sont aussi fréquentes que les mariages officiels et sont considérées comme des mariages par les usages locaux. En cette occurence, les statistiques des mariages donnent par conséquent une idée trompeuse du taux réel de formation des familles.

La nécessité d'obtenir des statistiques sur les unions consensuelles a été reconnue par la Commission de statistique dans les *Principes directeurs d'un système de statistiques de l'état civil*[29] (Principe 101). ". . . Il y aurait intérêt notamment à étudier des méthodes permettant d'obtenir des données sur les unions qui ne sont pas enregistrées (connues sous les noms divers de mariages "de droit commun", "coutumiers" ou "consensuels"), en reconnaissant que, par le caractère même des faits sur lesquels elles portent, ces données ne peuvent être recueillies, par la méthode d'enregistrement telle qu'elle est définie au Principe 102."

Jusqu'à ce qu'un procédé d'enregistrement de ces unions "non enregistrées" ait été mis au point, les statistiques des mariages continueront à se rapporter aux unions officielles ou légales et, en tant que telles, à être un indice trompeur de toutes les unions dont il est important de connaître le nombre aussi bien à des fins démographiques qu'au point de vue de la santé publique.

Les statistiques établies conformément à la définition

[28] *Op. cit.,* Principe 202.
[29] *Op. cit.*

légale que chaque pays donne du mariage ne sont pas composées de la même façon; elles dépendent des lois et des usages relatifs à l'enregistrement des mariages ainsi que de la manière dont sont recueillies les données. Ainsi, certains pays ne réunissent de statistiques que pour les mariages civils, bien que les mariages religieux soient quelquefois reconnus par la loi. Dans d'autres, les seuls relevés disponibles se trouvent dans les registres de l'église et les statistiques correspondent, par conséquent, aux mariages religieux seulement. Dans un ou deux pays les statistiques concernent les autorisations de mariage délivrées, c'est-à-dire, les documents officiels certifiant que les conditions à remplir pour se marier légalement (âge, consentement, état de santé, etc.) sont satisfaites. Le nombre des autorisations de mariage délivrées est nécessairement plus élevé que celui des mariages célébrés, car ces autorisations ne constituent que des déclarations d'intention qui ne sont pas toujours suivies de célébration du mariage. En l'absence de statistiques des mariages qui ont eu lieu elles constituent néanmoins une approximation assez bonne du nombre de mariages effectivement célébrés.

Degré de perfection des données. — Par suite de la composition différente des statistiques des mariages dans chaque pays (mariages civils ou religieux, ou les deux à la fois) il est assez difficile d'évaluer la mesure dans laquelle les données sont complètes, si on doit entendre par là qu'elles comprennent tous les mariages ou unions qui ont eu lieu. Du reste, le concept de "perfection" des données (c'est-à-dire la mesure dans laquelle elles sont plus ou moins complètes) est vraiment difficile à définir dans le cas des mariages parce que, dans la plupart des pays du monde l'union devient légale au moment même où elle est enregistrée. Toutefois, dans quelques uns, comme les Etats-Unis, et dans ceux où les mariages religieux sont seuls légaux, le fait d'inscrire le mariage sur le registre de l'état civil constitue un acte distinct de la célébration propre et, en de telles circonstances, il y peut exister une disparité entre le nombre de mariages légaux effectivement célébrés et celui des mariages enregistrés. En raison de ces considérations, le degré de "perfection" des données communiqué par les pays est indiqué dans le tableau 32 à l'aide des lettres "C" ou "U" du code qui dénotent des statistiques "complètes" ou "incomplètes" des mariages, quelle qu'en soit la définition.

Du fait qu'il peut s'écouler un certain temps entre la célébration d'un mariage et son enregistrement le symbole (†) a été utilisé dans le tableau 33 comme dans les autres tableaux pour désigner les statistiques établies d'après la date de l'enregistrement plutôt que d'après celle du mariage. Ainsi qu'on l'a déjà mentionné ce détail est plus important lorsqu'il s'agit de naissances vivantes. Il n'empêche qu'avec les renseignements sur la nature de données se trouvant à la base des statistiques, il peut être utile de le garder à l'esprit lorsqu'on étudiera les statistiques des tableaux 32 et 33.

Tableau 32

Ce tableau qui correspond par sa composition aux tableaux 28 et 31 indique les nombres de mariages célébrés de 1946 à 1953 ainsi que les taux bruts de nuptialité pour la période de 1920 à 1939 et de 1946 à 1953. Les taux se présentent sous la forme de moyennes pondérées quinquennales de 1920 à 1939 et sous celle de taux annuels de 1946 à 1953.

Portée

Ce tableau comprend 150 pays et territoires, probablement un peu moins qui en auraient été représentés si on y avait publié uniquement les "nombres de mariages" parce que quelques uns des chiffres de la population servant de base au calcul des taux ont fait défaut. Comme dans les tableaux similaires des naissances vivantes et des décès certains territoires sur lesquels on n'a pas de données récentes ne figurent pas dans le tableau. On remarquera également que bien que la portée géographique du tableau paraisse assez étendue, elle est relativement limitée pour la majeure partie de l'Afrique où les données ne se rapportent qu'à de petites fractions de la population totale.

Calcul des taux

Les taux du tableau 32, comme les taux bruts correspondants des autres tableaux, représentent le nombre de mariages signalés à l'intérieur des frontières du pays considéré pour 1 000 personnes dans la population présente au milieu de l'année. Dans quelques cas seulement on s'est servi d'une estimation à une autre période de l'année ou des résultats d'un recensement au lieu de la population au milieu de l'année. Les populations au milieu de l'année ou autres, utilisées pour le calcul des taux sont en général, les chiffres officiels qui se trouvent dans les tableaux 1 et 2. Par suite, en l'absence d'un chiffre officiel de population on n'a pas calculé de taux même si le nombre des mariages était disponible. Il se peut néanmoins que des taux soient indiqués pour des populations qui ne figurent pas dans le tableau 2 si les données se rapportent seulement à une fraction de la population ou lorsque les années au sujet desquelles on est en mesure de les présenter sont seulement celles déjà mentionnées dans le tableau 1. Mais, d'une manière générale il suffit de se reporter au tableau 2 pour savoir ce que représentent les populations à partir desquelles ont été calculés les taux figurant dans le tableau 32.

Insuffisances des données

Ainsi qu'on l'a déjà mentionné, ce tableau comme tous les autres qui indiquent l'évolution à long terme du mouvement de la population est accompagné d'un code permettant d'apprécier la qualité des données, qui se présente sous la forme des lettres "C" ou "U" disposées dans la première colonne du tableau. Des explications ont été données précédemment sur ce code à la page 60.

En examinant les taux bruts du tableau 32 on s'aperçoit aisément du défaut de comparabilité résultant des variations dans la définition du "mariage" et des différences qui existent entre les pays dans la proportion des unions "consensuelles", c'est-à-dire de celles qui ne sont pas enregistrées à l'état civil. Les taux extrêmement faibles relatifs à certains pays, particulièrement en Amérique du Sud, sont attribuables en grande partie à la prédominance des unions consensuelles, quoique dans certains cas, des lacunes dans l'enregistrement des mariages légaux aient pu y contribuer.

Les taux bruts de nuptialité, comme ceux de natalité et de mortalité n'offrent qu'un intérêt limité dans le

domaine de l'analyse. Les mariages ont une autre signification lorsqu'ils sont rapportés à la population "mariable", c'est-à-dire aux célibataires en âge de contracter mariage, aux veufs et aux divorcés. Néanmoins, ces taux bruts mesurent les variations de la fréquence des mariages dans la population totale, et les fluctuations du taux sont souvent le reflet de changements survenus dans les conditions économiques et sociales du pays considéré.

Tableau 33

Des taux de nuptialité selon l'âge et le sexe figurent dans le tableau 33. Celui-ci comprend 39 pays et territoires au sujet desquels les taux sont indiqués pour la période 1936-1953. Les taux auxquels se rapportent les groupes d'âge sont, "moins de 20 ans", quinquennaux de 20 à 64 ans et "65 ans et plus".

Portée

Ce tableau, de même que les tableaux similaires selon l'âge pour les naissances vivantes et les décès, a une portée très limitée du fait que les chiffres de plusieurs populations correspondantes pour le calcul des taux de nuptialité par âge et par sexe ont fait défaut. Les taux dont il est question reposent sur la population classée par âge, par sexe et par état matrimonial, répartitions que l'on n'obtient en général qu'à la suite de recensements de population. Conformément au Principe 410, *e,* 23) du document déjà cité[30], les statistiques des mariages d'après l'âge des conjoints ont été établies dans 66 pays et territoires outre ceux qui figurent dans le tableau 33, mais soit que les nombres fussent trop petits ou que la population correspondante ne fût pas disponible, il n'a pas été possible de calculer les taux.

Calcul des taux

Les taux représentent le nombre d'époux ou d'épouses dans chaque groupe d'âge pour 1 000 personnes mariables du même âge et sexe. On entend ici par population "mariable" les célibataires, les veufs, les divorcés, les personnes vivant en état d'union consensuelle et celles dont l'état matrimonial n'est pas connu, de 15 ans et plus ainsi que les personnes d'âge inconnu.

Comme dans les pays considérés les mariages de personnes de moins de 15 ans représentent une fraction négligeable de l'ensemble, le taux relatif au premier groupe d'âge est basé sur les mariages de personnes de moins de 20 ans mais a été calculé d'après la population mariable de 15 à 19 ans. Le taux relatif au dernier groupe d'âge de 65 ans et plus repose sur les mariages de personnes de ces âges et a été calculé sur la population correspondante. Toutefois, le "taux général" est fondé sur les mariages à tous âges (y compris les âges inconnus) et a été calculé à partir d'une population dans laquelle figurent également les personnes d'âge inconnu. Mais du fait que ce taux ne s'applique qu'à certains âges et à la population mariable seulement il ne peut concorder avec le taux de nuptialité pour l'ensemble des mariages (ou taux brut de nuptialité) publié dans le tableau 32. Et si l'on compare les données du tableau 32 avec celles de ce tableau on remarquera que, dans quelques cas les taux bruts manifestent une tendance à la baisse là où les taux spécifiques accusent une tendance à la hausse. Cela indique que la valeur des taux en tant qu'indices de l'évolution de la nuptialité est assez limitée.

Insuffisances des données

Une des principales limitations des données de ce tableau est qu'elles sont disponibles pour des pays et territoires relativement peu nombreux et des années très éloignées les unes des autres parce que les chiffres de population de base ne sont en général fournis que par les recensements. Il n'est pas toujours possible, en conséquence, de calculer des taux pour les années courantes, d'autant que le fait de prendre pour base des données relatives à une année déjà ancienne peut induire en erreur, surtout lorsque la fréquence des mariages varie rapidement, comme cela arrive par exemple en cas de guerre.

La définition des mariages et celle de la "population mariable" utilisée pour le calcul des taux constituent un autre facteur limitatif. Il importe de ne pas perdre de vue les différences qui existent, suivant les pays, entre le nombre de mariages signalés (c'est-à-dire mariages civils, religieux ou les deux à la fois) d'une part, et dans l'attitude adoptée vis à vis des personnes vivant en état d'union consensuelle, d'autre part, lorsqu'on utilisera les statistiques de ce tableau. En outre, la population selon l'âge, le sexe et l'état matrimonial qui sert de base aux taux est également sujette à toutes les restrictions qui affectent les répartitions par âge de la population en général. Celles-ci ont été exposées à la page 52.

Les indications du code (tableau 32), permettant d'apprécier la mesure dans laquelle les données sont complètes sont valables ici, quoique, ainsi qu'on l'a déjà expliqué sa signification est assez faible en ce qui concerne l'enregistrement des mariages. De même, les conséquences de l'établissement des statistiques d'après la date de l'enregistrement sont minimes dans ce tableau.

Statistiques des divorces

Les tableaux statistiques 34 et 35 sont consacrés aux divorces. Sauf indication contraire, les données qui y sont présentées se rapportent aux divorces prononcés qui ont été communiquées par chacun des pays. On a utilisé pour l'établissement de ces statistiques la définition suivante du divorce qui est celle recommandée par les Nations Unies dans les *Principes directeurs d'un système de statistiques de l'état civil*[31]:

> Le divorce est la dissolution légale et définitive des liens du mariage, c'est-à-dire la séparation de l'époux et de l'épouse par décision judiciaire conférant aux parties le droit de se remarier civilement ou religieusement, ou les deux à la fois, conformément aux lois en vigueur dans chaque pays.

Cette définition restreint de ce fait la portée des données des tableaux 34 et 35 aux "divorces prononcés" et en écarte les "séparations légales" et "annulations". Les divorces signalés peuvent avoir été prononcés par des tribunaux religieux ou civils suivant la loi de chaque pays; ils peuvent avoir été enregistrés par les tribunaux seulement ou par ceux-ci et l'officier de l'état civil; les statis-

[30] *Principes directeurs d'un système de statistiques de l'état civil, op. cit.*

[31] *Op. cit.,* Principe 202.

tiques peuvent être tirées directement des registres des tribunaux ou bien provenir de celles transmises sur les divorces. Ces différents facteurs n'ont aucune influence réelle sur la nature des données. On n'en a pas moins indiqué en note ce que représentent les chiffres de divorces contenus dans ce tableau lorsqu'on possédait des renseignements à cet égard.

Dans la mesure du possible, les statistiques concernent les divorces enregistrés pendant une période déterminée parmi la population présente du pays ou territoire considéré. Comme pour les mariages, les divorces qui se sont produits chez les tribus ou les groupes indigènes isolés des formes de civilisation actuelle sont invariablement exclus des statistiques.

Insuffisances des données

Les données sont sujettes aux mêmes considérations juridiques que celles dont il a déjà été question à propos des mariages. Elles sont même peut-être plus fortement affectées par les différences considérables qui existent entre les lois et procédures relatives à la dissolution du mariage, en vigueur dans les divers pays. Ces législations vont de la prohibition totale (Brésil, Chili, Colombie, Espagne, Irlande, Italie, entre autres), à l'attribution facile du divorce sur la simple manifestation d'un désir ou d'une intention de se séparer, en passant par tous les motifs possibles de divorce. Bien entendu, les nombres sont relativement plus petits dans les régions où le divorce est difficile à obtenir, quoique la diversité des traditions sociales soit aussi un facteur dominant dans les fluctuations de la courbe des divorces. Ces deux éléments ne sont d'ailleurs pas sans rapport.

En raison de ces différences, les taux de divorce ne peuvent être considérés comme un indice de la véritable proportion des unions dissoutes du point de vue démographique et social, de nombreux mariages étant détruits autrement que par le divorce (décès, abandon du foyer, etc.). Ils sont le reflet de la mesure dans laquelle la population peut supporter les frais de cette procédure ou de la sévérité des lois sur le divorce plutôt qu'une indication précise de la fréquence des ménages brisés et des déunions familiales.

Dans les pays où la polygamie est une institution reconnue, les statistiques des divorces ont une signification quelque peu différente. Dans ces régions, le facteur que constitue la liberté de prendre un autre époux est relativement peu important, tout au moins pour les hommes, et les divorces sont plus fréquents qu'ailleurs. L'Egypte reconnaît par exemple trois sortes de divorces (le divorce révocable, la séparation et le divorce définitif) lesquels s'attachent à considérer les possibilités de renouer le mariage plutôt que celles d'en contracter de nouveaux. Ces divorces prévoient aussi des obligations économiques et financières; il est vrai que c'est là une clause permanente dans la législation sur les divorces des autres pays.

Définitions. — On remarquera que dans les tableaux un certain nombre de pays comprennent les annulations dans leurs statistiques des divorces. D'après les *Principes directeurs d'un système de statistiques de l'état civil*[32], l'annulation est "la déclaration de l'invalidité ou de la nullité d'un mariage prononcée par une autorité compétente, conformément à la législation de chaque pays; l'annulation rend aux parties le statut qu'elles avaient avant le mariage". Ainsi l'annulation est différente du divorce parce que le mariage annulé est réputé ne pas avoir existé au lieu d'être dissous mais elle s'en rapproche du fait que, comme lui, elle confère aux deux parties le droit de se remarier. Dans les pays où le divorce, défini comme précédemment, est reconnu, le nombre d'annulations est d'ordinaire assez faible. Il convient de noter toutefois que, dans les régions où le divorce est prohibé, l'annulation tend à remplacer le divorce comme moyen de dissolution du mariage.

L'inclusion, dans quelques cas, de séparations légales dans les statistiques des divorces contribue également à affecter la comparabilité entre les séries. En général "La séparation légale est la séparation des époux à la suite d'une décision judicaire conformément à la législation du pays. La séparation légale ne confère pas aux parties le droit de se remarier"[32]. Dans certaines régions, en Suède par exemple, la séparation légale n'est qu'une phase préliminaire du divorce, celui-ci étant automatiquement accordé après une certaine période de séparation.

Enfin, toujours en ce qui concerne la définition des données présentées, il faut ajouter que plusieurs pays communiquent le nombre "d'instances en divorce" plutôt que celui des "divorces prononcés". Il existe entre ces deux termes à peu près le même rapport qu'entre les "autorisations de mariage délivrées" et les "mariages effectivement célébrés"; cependant on peut dire, pour les divorces, que le nombre d'instances en cours devant les tribunaux constitue une approximation assez exacte des divorces prononcés quoique chaque demande déposée devant un tribunal ne donne pas toujours lieu à un arrêt en divorce. Lorsqu'on utilise les statistiques des "instances en divorces" plutôt que celles de "divorces prononcés" il importe de garder à l'esprit que les dates auxquelles se rapportent "les événements considérés" sont différentes. Dans de tels cas par exemple "l'âge des divorcés" ou celui des "enfants à charge", etc., sont ceux au moment de l'instance en divorce introduite devant les tribunaux plutôt que ceux lorsque le divorce a été prononcé et cela peut représenter un décalage de plusieurs années.

Degré de perfection des données. — Une appréciation de la mesure dans laquelle les données sont complètes est encore plus difficile pour les divorces que pour les mariages, parce que la prononciation d'un divorce est un acte juridique qui, par sa nature, doit être enregistré. Les statistiques des divorces reposent sur les arrêts enregistrés qui sont directement communiqués par les tribunaux religieux ou civils en cause, ou qui sont transmis par ces tribunaux aux bureaux de statistiques nationaux. Dans les deux cas, il est permis de penser qu'un certain nombre de divorces enregistrés ne sont pas comptés dans les statistiques, plus particulièrement ceux qui ont été prononcés par les tribunaux religieux, et il sera utile de consulter à ce sujet le code qui se trouve dans le tableau 34. Les éléments de ce code ont été exposés à la page 60.

Comme pour les mariages l'établissement des statistiques d'après la date de l'enregistrement plutôt que d'après celle de l'événement n'a pas une importance

[32] *Op. cit.*, Principe 202.

[33] *Principes directeurs d'un système de statistiques de l'état civil, op. cit.*, Principe 202.

appréciable sur la comparabilité des données. Il se peut qu'un certain temps s'écoule entre l'arrêt et son enregistrement à l'état civil, mais le délai ne saurait dépasser l'intervalle courant de transmission des données qui est normalement d'un mois ou d'un trimestre. Par suite, du manque d'homogénéité des données le symbole (†) permettant de distinguer à partir de quelle date (enregistrement ou événement) les données ont été établies, n'a pas été introduit dans ce tableau.

Tableau 34

Le tableau 34 présente les nombres de divorces prononcés ainsi que les taux bruts annuels de divorce pour les années 1946 à 1953.

Portée

Sauf indication contraire, les statistiques se rapportent à la population présente de 104 pays et territoires. Cette portée relativement étendue pour des statistiques de divorces est quelque peu inférieure à ce qu'elle aurait pu être pour diverses raisons. Ainsi que cela a été le cas dans les autres tableaux indiquant l'évolution à long terme du mouvement de la population, la portée géographique de celui-ci a été réduite parce que les chiffres de population servant de base au calcul des taux n'étaient pas toujours disponibles pour les années 1946 à 1953 et également du fait que, dans certaines régions, le nombre de divorces était trop petit pour qu'on puisse obtenir des taux significatifs. Dans ce tableau comme dans ceux des naissances vivantes, des décès et des mariages la portée des données pour l'Afrique est extrêmement limitée.

Calcul des taux

Les taux bruts de divorce représentent le nombre de divorces prononcés, communiqués pendant une période déterminée pour 1 000 personnes dans la population estimée au milieu de l'année ou à une autre période de l'année. En général, les chiffres de population à partir desquels on a calculé les taux sont les estimation officielles ou les résultats de recensements qui figurent dans les tableaux 1 et 2. C'est également en se reportant à ces tableaux qu'on pourra savoir ce que représentent les données qui constituent le dénominateur des taux et si ce sont des chiffres révisés ou non. Ainsi qu'on l'a déjà mentionné, le manque de chiffres officiels de population a réduit considérablement le nombre d'années pour lesquelles on a pu indiquer des taux même lorsque des données sur les divorces étaient disponibles.

Insuffisances des données

On trouvera dans la première colonne du tableau 34 le code permettant d'évaluer la qualité des données dont il a déjà été question. Les indications du code sur la mesure dans laquelle les données sont complètes, sont applicables de la même manière au tableau 35 qui renferme des taux spécifiques de divorce.

Les nombres totaux de divorces et les taux bruts de divorce sont sujets aux mêmes restrictions que celles qui sont valables pour les statistiques des divorces en général, sans oublier les disparités déjà mentionnées entre les législations relatives au divorce et la variété qui existe dans la nature des données auxquelles se rapportent les statistiques des divorces. De plus, les taux bruts de divorce calculés par rapport à la population totale ont une valeur limitée comme tous les taux de cet ordre. Les taux bruts de divorce sont une mesure de la fréquence de la dissolution des mariages par le divorce ou des variations qui en résultent dans la population mariable; mais, par suite de la composition différente des populations selon l'état matrimonial et l'âge ils ne renseignent pas sur les probabilités de divorce parmi les personnes mariés ou les couples. Ils ne donnent qu'une idée générale des tendances dans le temps et des écarts existant entre les niveaux de divorce des divers pays, ces considérations étant affectées de façon permanente par les innombrables acceptions du terme "divorce" sur le plan international.

Tableau 35

Comme les taux bruts de divorce risquent d'induire en erreur sur la fréquence relative des divorces parmi les personnes mariées, c'est-à-dire en état de se réclamer de cette institution, des taux de divorce plus représentatifs reposant sur la partie de la population formée par les couples mariés sont publiés dans le tableau 35. Ces taux, présentés sous la forme de moyennes triennales portent sur la population présente de 53 pays et territoires pour certaines années de la période 1935-1953.

Portée

Pour obtenir ces taux, il fallait que des statistiques de la population classée selon l'état matrimonial soient disponibles ainsi que des données sur les divorces pour trois années consécutives telles que l'on possède pour la deuxième un chiffre officiel de population. A part quelques exceptions (Suède, Pays-Bas, Angleterre et le Pays de Galles, par exemple), des statistiques de la population selon l'état matrimonial ne sont régulièrement disponibles qu'à la suite d'un recensement. En conséquence la portée du tableau 35 est extrêmement réduite. Des statistiques sur le nombre total de divorces existent actuellement pour 104 pays et territoires mais le tableau 35 n'en comprend que 53 par suite du nombre insuffisant de régions pour lesquelles on a pu se procurer des données selon l'état matrimonial.

Calcul des taux

Les taux figurant dans le tableau représentent la moyenne annuelle de divorces prononcés sur une période de trois ans pour 1 000 couples mariés dans la population de l'année médiane de la période considérée. On a choisi les trois années dont la moyenne devait être effectuée en fonction de celle pour laquelle des statistiques sur la population selon l'état matrimonial étaient disponibles. Cette année peut être soit celle d'un recensement soit celle pour laquelle il existe une estimation officielle de la population suivant l'état matrimonial. On a déterminé le nombre de couples mariés dans la population en faisant la moyenne du nombre d'hommes et de femmes qui ont déclaré être "mariés" et "séparés" lors du recensement, ou, pour une année où il n'y eut pas de recensement, des nombres estimés dans la rubrique "mariés". On entend par "marié" dans ce tableau les personnes unies par un mariage légal, c'est-à-dire que celles vivant en état

d'union consensuelle ne sont pas comprises et sont considérées comme faisant partie de la population "mariable". Les personnes légalement séparées figurent dans les statistiques des "mariés" dans la mesure où leurs mariages n'ont pas encore été dissous. Chaque fois que les données d'un pays s'écartent de ces définitions de base, on l'a indiqué en note.

Insuffisances des données

Bien entendu les limitations dont souffrent les statistiques des divorces en général par suite de la nature des données de base sont valables dans ce tableau mais il importe de bien s'assurer de la composition de la population de base, particulièrement en ce qui concerne la répartition des personnes vivant en état d'union consensuelle et de celles légalement séparées, si l'on veut avoir une idée exacte de la valeur des taux de divorce selon l'état matrimonial. Les statistiques de plusieurs pays représentés dans le tableau 35 comprennent les personnes vivant en état d'union consensuelle dans la population mariée, les taux de divorces accusant alors une erreur par défaut, tandis que, dans d'autres régions, toutes les personnes légalement séparées sont exclues de cette même population provoquant ainsi une erreur par excès dans les taux. De telles divergences sont heureusement assez rares dans l'ensemble et il faut reconnaître que les facteurs qui limitent surtout la valeur des taux spécifiques sont ceux que l'on a déjà exposés à propos des statistiques des divorces en général. En évaluant leur importance (inclusion des annulations ou des séparations légales, "instances en divorce" au lieu de "divorces prononcés", etc.) et celle des disparités qui existent entre les législations relatives au divorce dans les différents pays, il est facile de se convaincre que les taux spécifiques calculés sur la population mariée sont les meilleurs indices de la fréquence relative des divorces. Bien que l'augmentation générale du nombre de divorces soit assez importante et continue pour éclipser les conséquences de l'utilisation de la population totale plutôt que de la population spécifique comme base de calcul des taux, l'évolution des divorces étudiée au moyen des taux spécifiques est toute autre que celle indiquée par les taux bruts.

TABLES DE MORTALITE

Les tableaux 36, 37 et 38 présentent, pour la période 1900-1953, des valeurs de certaines fonctions des tables de mortalité qui n'ont pas encore été publiées dans l'*Annuaire démographique*. Ces données viennent donc compléter celles des tableaux correspondants de l'édition 1953 de l'*Annuaire* qui comprenaient les statistiques de toutes les tables de mortalité disponibles à cette époque.

Les valeurs de trois fonctions sont indiquées: dans le tableau 36, la probabilité de décès dans le délai d'un an ou dans un intervalle d'âge déterminé pour les personnes d'un âge donné (q_x); dans le tableau 37, les survivants au début de chaque intervalle d'âge sur une génération de 100 000 individus (l_x); et, dans le tableau 38, la vie moyenne restant à vivre ou l'espérance moyenne de vie pour les personnes d'un âge donné (e_x). Dans les trois tableaux, des données figurent pour chaque année au-dessous de 5 ans et pour chaque cinquième année ensuite jusqu'à 85 ans.

Les tables de mortalité reposent sur l'observation des conditions de mortalité pendant une certaine période, mais elles se prêtent à une analyse plus détaillée des incidences et perspectives découlant de ces conditions que les taux classiques de mortalité qui figurent au tableau 29.

Bien que les tables de mortalité aient d'abord été développées en vue de calculs actuariels, elles ont de nombreuses applications dans le domaine démographique. Citons parmi celles-ci: 1) la prévision de la composition de la population par âge et sexe; 2) l'analyse des incidences de la mortalité sur la répartition par âge et par sexe d'une population donnée; 3) la comparaison des mesures sommaires de mortalité telles que les quotients de mortalité (réciproques de l'espérance de vie à la naissance), l'espérance de vie à différents âges, etc.; 4) le calcul des taux nets de reproduction; 5) l'évaluation de l'exactitude des recensements et de l'enregistrement des données de l'état civil. En outre, la technique des tables de mortalité a été appliquée à l'analyse d'autres genres de données démographiques, par exemple au calcul des probabilités de mariage, par âge et par sexe, sur la base des chiffres de recensements classés suivant l'état matrimonial.

Portée

Des données relatives à diverses périodes sont présentées pour 18 pays et territoires dans le tableau 36, pour 20 dans le tableau 37 et pour 21 dans le tableau 38. Il est à regretter qu'on n'ait pu se procurer de statistiques sur de nombreuses régions du monde pour lesquelles des renseignements valables sur le chiffre de la population et le nombre total de décès font encore défaut.

Evaluation de la qualité des données

L'exactitude des tables de mortalité dépend surtout de l'exactitude et du caractère plus ou moins complet de l'enregistrement des décès et des dénombrements de population effectués lors des recensements. Les lacunes sont probablement plus grandes dans l'enregistrement des décès que dans les recensements. Dans ce cas, les taux de mortalité sont sous-estimés et les valeurs de l_x et de e_x surestimées. Les taux de mortalité calculés à partir des statistiques de la population et de la mortalité pour les premiers âges de la vie risquent, tout particulièrement, d'être sous-estimés; une erreur de ce genre affecte toutes les valeurs de l_x dans la table de mortalité. Comme on l'a déjà indiqué, les taux de mortalité infantile obtenus en comparant le nombre de décès d'enfants de moins d'un an et le nombre de naissances dans les pays où l'enregistrement est incomplet risquent d'être supérieurs ou inférieurs à la réalité; que l'erreur se produise dans un sens ou dans l'autre, elle aura des répercussions importantes sur les valeurs de l_x se rapportant à chaque âge. L'espérance de vie à la naissance (e_o) sera alors également surestimée ou sous-estimée.

L'exactitude et la comparabilité internationale des valeurs des tables de mortalité relatives aux âges avancés sont particulièrement discutables. Ces valeurs sont extraites comme on l'a déjà indiqué, de données incomplètes qui ont fréquemment fait l'objet d'ajustements quelque peu arbitraires. Certains traits remarquables —

par exemple le fait que l'espérance de vie au-delà de 60 ans est souvent nettement plus élevée dans les pays où la mortalité est forte en général que dans les pays ayant de faibles taux de mortalité — peuvent ainsi être uniquement le résultat des imperfections des tables de mortalité.

La variété qui préside aux méthodes utilisées pour l'établissement des tables de mortalité (ajustement des données, etc.) peut altérer le degré d'exactitude des résultats et nuire à leur comparabilité sur le plan international. Toutefois, cette variété a probablement des répercussions beaucoup moins prononcées que celles qui résultent des lacunes des recensements et de l'enregistrement des décès.

Tableau 36

On trouvera dans ce tableau des quotients de mortalité pour 18 pays et territoires . Les quotients de mortalité représentent la probabilité de décès dans les limites d'un certain intervalle de vie, en général un an. Ils constituent la fonction de base de la table de mortalité; cette fonction est communément représentée par q_x, la valeur devenant pour un âge et un nombre spécifiés, q_0 au-dessous d'un an, q_1 à l'âge d'un an, etc. Les valeurs figurant dans le tableau sont exprimées en 1 000 q_x et indiquent le nombre de décès parmi 1 000 individus atteignant l'âge x ou la probabilité de décès pour ces 1 000 individus de l'âge x à l'âge $x+1$ (ou à l'intérieur d'un intervalle d'âge donné).

Le quotient de mortalité diffère du taux de mortalité en ce sens qu'il concerne les individus atteignant l'âge spécifié au cours d'une année plutôt que les personnes de cet âge au milieu de l'année. Ainsi les quotients reposent sur la même conception que les taux de mortalité infantile présentés dans le tableau 31. Mais les quotients de mortalité pour les enfants au-dessous d'un an sont en général différents des mêmes taux indiqués dans ce tableau, du fait que ces derniers ont été établis de telle manière que les décès d'enfants de moins d'un an sont rapportés au groupe de naissances dans lequel ils étaient compris.

La table complète de mortalité donne des valeurs pour chaque année de vie. Une table de mortalité abrégée indique des valeurs par groupes d'âge, de cinq années en général. Quelques-unes des statistiques du tableau qui entrent dans ce cas ont été signalées en conséquence. En cette occurrence, le quotient de mortalité est la probabilité de décès non pas dans le délai d'un an après avoir atteint l'âge spécifié, mais dans celui de cinq ans après cet âge (ou au cours du nombre d'années spécifié).

Les procédés de construction de la table de mortalité varient quelque peu, dépendant pour une large mesure de l'existence et de la nature des données de base. La valeur de q_x est généralement calculée de façon à correspondre au taux de mortalité des personnes ayant cet âge, au cours d'une période déterminée. Les données de base sont généralement les suivantes: *a*) décès au cours d'une période déterminée, classés par âge et sexe; et *b*) population moyenne par âge et par sexe au cours de cette période. La méthode la plus employée consiste à utiliser les statistiques de décès s'étendant sur une période de trois ou cinq ans, choisies de telle sorte que la date du recensement se situe à peu près au milieu de la période; ainsi, les données du recensement peuvent être considérées comme indiquant la population moyenne. On se sert quelquefois de la période qui s'étend entre deux recensements, dans ce cas, les nombres utilisés sont la moyenne des résultats des deux recensements. Il arrive aussi que l'on procède à un ajustement pour tenir compte des mouvements de population. Dans quelques rares cas (en Inde, par exemple), des tables de mortalité approximatives ont été calculées sans recourir aux données relatives aux décès; la valeur de q_x a été établie en comparant le chiffre de la population dénombrée dans chaque groupe d'âge, lors d'un recensement, avec le nombre de survivants au recensement suivant. Il est de pratique courante de procéder à des corrections afin de rectifier les déclarations d'âge inexactes faites lors des recensements et de l'enregistrement des décès et afin d'obtenir une série de valeurs q_x ayant une allure régulière.

Des problèmes spéciaux se posent quand il s'agit de calculer les valeurs de q_x pour les premiers âges et les âges avancés. On obtient souvent les valeurs de q_x pour les premiers âges en utilisant les statistiques des naissances survenues au cours des toutes dernières années et en estimant par déduction le nombre d'enfants susceptibles de décéder au cours de la période à laquelle se rapporte la table de mortalité. Lorsqu'il s'agit des âges avancés, les données sont très souvent si rares et si discutables qu'elles doivent être remaniées de façon sensible pour pouvoir fournir une série correcte de valeurs de q_x. Dans de nombreux cas, les valeurs de q_x figurant dans les tables de mortalité pour les âges avancés ne sont nullement liées aux décès enregistrés pour ces âges; elles sont évaluées à partir des valeurs de q_x concernant les personnes moins âgées.

Tableau 37

Le tableau 37 donne des valeurs (l_x) de la table de survie. Ces chiffres sont dérivés des valeurs de q_x et représentent le nombre de survivants de chaque âge sur 100 000 (10 000 ou 1 000) individus nés vivants et soumis de ce fait aux conditions de mortalité de la table de mortalité en cause. En d'autres termes, ils mesurent les probabilités pour un nouveau-né d'être encore vivant aux âges spécifiés, ces probabilités étant exprimées pour 100 000, 10 000 ou 1 000, suivant le cas.

Tableau 38

Le tableau 38 indique "l'espérance de vie" (e_x) ou le nombre moyen d'années restant à vivre pour les personnes atteignant les âges spécifiés. Ces données reposent également sur les quotients de mortalité et doivent être interprétées strictement suivant le principe selon lequel les groupes de survivants sont soumis, pour chaque âge, aux conditions de mortalité de la période couverte par la table de mortalité. Ainsi peut-on dire, en interprétant e_{50} dans la table de mortalité 1945-1948 relative à la Norvège, qui si les hommes atteignant l'âge de 50 ans restent soumis aux mêmes conditions de mortalité que celles qui sont valables pour la période 1945-1948, ils vivront en moyenne 26,4 années après cet âge.

MOUVEMENTS INTERNATIONAUX DE POPULATION

Les tableaux 39 à 43 concernent les mouvements internationaux de populations. Ils contiennent des statistiques sur les voyageurs internationaux, classées suivant les catégories principales de sorties et d'entrées, et sur deux de ces catégories principales, celles des émigrants et immigrants permanents. Ces dernières statistiques sont classées selon le pays de résidence permanente, prévue ou précédente, et selon le sexe et l'âge. Dans les travaux démographiques, les données relatives aux migrants permanents sont les plus utiles et elles ont été beaucoup plus détaillées que celles qui se rapportent aux voyageurs internationaux.

La composition des tableaux est conforme aux *Recommandations concernant l'amélioration des statistiques des migrations internationales* établies par les Nations Unies.[34] Ces *Recommandations* furent adoptées par les Commissions de la Population et de Statistique du Conseil économique et social, après des consultations détaillées avec les gouvernements et les organisations internationales intéressées; elles furent approuvées par le Conseil dans la résolution 469.E(XV) du 27 avril 1953.

Les *Recommandations* accordent une égale importance à la publication par chaque pays de certaines répartitions des migrants permanents autres que celles dont on a fait mention ci-dessus, à savoir la répartition suivant le pays de nationalité juridique et, pour les migrants en âge de travailler, la répartition suivant la profession habituelle, établie séparément pour chaque sexe. Il n'a pas été possible d'inclure des tableaux de ce genre dans la présente édition de l'*Annuaire démographique* parce que le nombre des pays pour lesquels on disposait de données adéquates était trop petit, ou par suite de difficultés d'ordre méthodologique.

EVALUATION DE LA QUALITE DES DONNEES[35]

Une statistique des mouvements internationaux de populations entièrement satisfaisante indiquerait le nombre de toutes les personnes qui ont traversé une frontière internationale pendant une période de temps considérée, la direction de leurs déplacements, et leurs caractéristiques. Pour différentes périodes, et pour différents groupes tels que les émigrants et immigrants, les visiteurs et résidants rentrant dans le pays, les chiffres seraient compatibles entre eux pour un pays donné et comparables pour les différents pays. Ceci implique l'emploi de nomenclatures et méthodes de rassemblement des statistiques qui seraient uniformes ou équivalentes, telles que celles qui sont décrites dans les *Recommandations*. Les séries établies par les différents pays conformément à ces normes pourraient facilement être intégrées dans une suite de tableaux internationaux qui donneraient une représentation complète et sans double emploi des mouvements des voyageurs et migrants internationaux.

Les données dont on dispose ne sont pas généralement conformes aux normes posées dans les *Recommandations*. Elles constituent seulement des fragments du tableau complet des voyages et migrations internationaux mentionné ci-dessus. Une amélioration notable des statistiques des migrations exigera du temps, car dans beaucoup de pays il faudra surmonter des difficultés administratives considérables; mais des progrès sont possibles par étapes successives. De fait, une amélioration sensible s'est produite au cours des dernières années au point de vue du nombre des pays pour lesquels des statistiques sur les mouvements internationaux de populations figurent dans l'*Annuaire démographique*, du nombre de séries complètes pour plusieurs années et plusieurs rubriques, de la compatibilité des chiffres publiés et de leur comparabilité internationale. On va procéder maintenant à une analyse plus détaillée des insuffisances des données existantes.

Pays et années représentés

Le nombre des pays pour lesquels des données figurent pour au moins une année sur un quelconque des tableaux 39 à 43 est 62. Pour plusieurs raisons, il serait désirable que les tableaux concernant les mouvements internationaux de populations comprennent un grand nombre de pays; mais il est plus important encore qu'ils donnent des renseignements suffisants sur les mouvements migratoires les plus considérables qui ont lieu dans le monde. A ce point de vue, les tableaux 39 à 43 sont plus satisfaisants que le simple examen du nombre des pays qui y figurent ne le ferait apparaître.

La représentation des pays est plus ou moins complète suivant les continents. Parmi les lacunes les plus notables, on peut citer le Brésil et certains autres pays d'Amérique du Sud et d'Amérique Centrale, pour les années les plus récentes, ainsi que la plupart des pays et territoires d'Afrique et d'Asie. En Europe, on ne dispose d'aucune statistique pour la France, on manque de données récentes sur les caractéristiques des migrants continentaux pour l'Italie et on n'a pas de renseignement sur les migrations continentales pour le Royaume-Uni.

Alors que les renseignements d'ordre statistique sur les voyageurs et les migrants sont généralement recueillis en une opération continue et concomittante des déplacements, des délais importants se produisent souvent dans l'exploitation de ces renseignements. Ces délais expliquent les lacunes que présentent les tablaux pour l'année 1953 et même pour 1952. En raison de l'intérêt qui s'attache à ce que les données soient à jour dans le domaine des migrations, ces lacunes sont regrettables; elles montrent qu'il y aurait lieu d'accélérer les procédures d'exploitation des statistiques en question. Quant au manque de données pour les années les plus anciennes, il correspond en réalité à un progrès dans beaucoup de cas; certains pays n'ont commencé que récemment à établir les statistiques considérées ici.

Conformément au paragraphe 27 des *Recommandations*, on a donné la préférence aux statistiques établies par année civile sur celles qui correspondaient à des années fiscales ou autres. Pour 2 pays, on disposait seulement de données de cette seconde catégorie, qui ont été

---

[34] On trouvera le texte des *Recommandations* au chapitre II de *Statistique des migrations internationales*, Nations Unies, Bureau de statistique. Etudes statistiques. Série M, No. 20, New York, 1953. Numéro de vente 1953.XVII.10.

[35] On trouvera une analyse comparative détaillée des statistiques des migrations de 69 pays ou territoires et un examen des difficultés qu'elles soulèvent dans *Problèmes de la statistiques des migrations*, Nations Unies, Département des questions sociales, Etudes démographiques, No. 5, Lake Success, 1949. Numéro de vente 1950.XIII.1. Les problèmes d'organisation et de technique posés par les statistiques des migrations, y compris ceux que soulèverait l'emploi possible des méthodes de sondage, sont exposés dans *Statistiques des migrations internationales*, Etudes statistiques, Série M, No. 20, cité ci-dessus.

incluses dans les tableaux. Pour 2 autres pays, on a publié certaines séries se rapportant à des années fiscales, en l'absence de données plus adéquates, et d'autres à l'année civile. Cette cause d'imperfection de la compatibilité des statistiques sur les mouvements internationaux de populations et de leur comparabilité internationale a perdu de son importance au cours des dernières années, à la suite des efforts accomplis par plusieurs pays pour produire des statistiques par année civile, parfois parallèlement à celles dont leur législation prescrit l'établissement par année fiscale.

Pour les données les plus récentes, se rapportant parfois à des périodes de moins d'un an, on peut consulter les *Informations sociales,* publiées deux fois par mois par le Bureau international du Travail.

Définitions et nomenclatures

Les problèmes de définition et de nomenclature se posent en des termes différents pour les statistiques des mouvements internationaux de populations et pour les autres statistiques démographiques. Les données provenant des recensements de populations et des registres de l'état civil, tout au moins les plus élémentaires d'entre elles, se rapportent à des évènements bien définis, tels que la présence d'une personne dans une région particulière, une naissance ou un décès. La traversée d'une frontière internationale par un voyageur est, de même, un fait susceptible d'être défini simplement; mais ce fait n'a pas en soi beaucoup de signification. Les concepts auxquels on a communément recours, tels que ceux d'émigrant et immigrant permanent, de migrant temporaire et de touriste, sont en grande partie conventionnels en ce sens qu'ils ne se rapportent pas à des caractéristiques évidentes et facilement reconnaissables des voyageurs, qui permettraient d'identifier et de compter ceux qui appartiennent à chaque catégorie. Les définitions résultant de textes législatifs ou administratifs varient beaucoup suivant les pays et parfois, pour un même pays, suivant le contexte. Dans la plupart des cas, cependant, ces définitions distinguent entre les voyageurs qui sont, et ceux qui ne sont pas, résidents du pays dont ils sortent ou de celui où ils entrent et tiennent compte du but et de la durée probable de leur séjour.

Pour pouvoir, malgrés cet état de choses, recueillir des statistiques sur les mouvements internationaux de populations qui soient à un degré raisonnable compatibles entre elles et internationalement comparables, il est indispensable d'établir des nomenclatures statistiques définissant avec précision ce qu'on veut énumérer, adaptées aux processus de rassemblement des données et de leur exploitation et, enfin, répondant aux besoins des utilisateurs de la documentation statistique dans le domaine considéré ici. La nomenclature utilisée dans le tableau 39 et dans les questionnaires sur les statistiques des migrations envoyées par le Bureau international du Travail aux différents pays, est fondamentalement la même que celle qui figure au paragraphe 17 des *Recommandations.* On y distingue quatre catégories principales de sorties et d'entrées, qui s'excluent mutuellement si bien qu'aucune personne ne doit être dénombrée sous plus d'une de ces catégories. La nomenclature est indiquée ci-après:

Sorties à destination d'autres pays (sauf le trafic frontalier)

1. Total des sorties (total des catégories 2 à 5).
2. Emigrants permanents: c'est-à-dire résidents (nationaux et étrangers) ayant l'intention de séjourner à l'étranger pendant plus d'un an.
3. Immigrants temporaires quittant le pays (les personnes à charge étant classées dans la catégorie 4).
4. Visiteurs quittant le pays à la fin de leur visite. Cette catégorie peut-être subdivisée selon le but du séjour.
5. Résidents (nationaux et étrangers) ayant l'intention de séjourner à l'étranger pendant un an au maximum.

— Cas spéciaux: chiffres séparés pour des groupes compris dans les catégories ci-dessus mais auxquels un pays donné s'intéresse particulièrement, par exemple: réfugiés; populations transférées; émigrants bénéficiant de facilités spéciales, comme une assistance financière gouvernementale, la prise en charge par des organisations intergouvernementales d'une partie de leurs frais de voyage, des facilités prévues par des accords bilatéraux ou plurilatéraux.

Entrées en provenance d'autres pays (sauf le trafic frontalier)

1. Total des entrées (total des catégories 2 à 5).
2. Immigrants permanents: c'est-à-dire non-résidents (nationaux et étrangers) ayant l'intention de séjourner dans le pays pendant plus d'un an.
3. Immigrants temporaires: c'est-à-dire non-résidents ayant l'intention d'exercer pendant un an au maximum une profession rémunérée dans le pays-même (les personnes à charge étant classées dans la catégorie 4).
4. Visiteurs: c'est-à-dire non-résidents ayant l'intention de séjourner dans le pays pendant un an au maximum sans y exercer une profession rémunérée dans le pays-même (et personnes à charge). Cette catégorie peut être subdivisée selon le but du séjour.
5. Résidents (nationaux et étrangers) rentrant dans le pays après un séjour d'un an au maximum à l'étranger.

— Cas spéciaux: chiffres séparés pour des groupes compris dans les catégories ci-dessus mais qui présentent un intérêt particulier à un moment donné, par exemplet: réfugiés; populations transférées; immigrants bénéficiant de facilités spéciales, comme une assistance financière gouvernementale, la prise en charge par des organisations intergouvernementales d'une partie de leurs frais de voyage, des facilités prévues par des accords bilatéraux ou plurilatéraux.

Trafic frontalier

On observera que pour les besoins de la statistique, la nomenclature distingue les migrants permanents des autres voyageurs par le fait qu'ils changent le pays de leur résidence pour plus d'un an. Les migrants temporaires sont distingués des autres voyageurs par le fait qu'ils vont prendre un emploi à l'étranger pour un an ou moins; les personnes allant à l'étranger pour un an ou moins pour d'autres raisons sont des visiteurs.

La fixation à un an de la ligne de démarcation entre mouvements "temporaires" et "permanents" reçoit une large adhésion de la part des pays qui ont fait un effort systématique pour clarifier leurs statistiques des migrations. Toutefois, dans le cas limite des personnes qui

changent leur résidence pour un an exactement (par exemple, les titulaires d'un contract de travail d'un an qui n'ont pas l'intention de le prolonger), les pays utilisent encore une classification d'un type plus ancien où les voyageurs en question sont compris parmi les migrants permanents, au lieu d'être comptés parmi les migrants temporaires, ou visiteurs, suivant les cas, comme le prévoit la nomenclature de 1953.[36]

On trouve dans les notes du tableau 39 et, parfois dans celles des tableaux 40 à 43, des exemples qui s'écartent des définitions ci-dessus. Ces écarts résultent soit de l'emploi de divers concepts de permanence, non normalisés, soit de la limitation des données à certains groupes de migrants tels que les étrangers ou les nationaux, ou à certain types de déplacements tels que les migrations continentales ou intercontinentales, les voyages par mer ou à travers les frontières terrestres.

Les possibilités d'interprétation des séries statistiques et la comparabilité internationale de celles-ci sont ainsi assez sérieusement limités. Dans certains cas, la limitation correspond à une sérieuse lacune dans notre connaissance du nombre et des caractéristiques des migrants. On peut alors parfois déduire des renseignements supplémentaires de certaines sources indirectes; mais ce procédé risque d'être laborieux et la validité des résultats est souvent incertaine. Dans d'autres cas, la limitation est assez superficielle, comme par exemple lorsqu'un groupe est exclu parce que son importance est si minime que les frais de dénombrement ne seraient pas justifiés, ou du moins était ainsi considérée quand on a fixé les procédures pour recueillir les statistiques des migrations. Il appartient à chaque usager d'apprécier, en égard au but qu'il poursuit, si l'élément qui manque est négligeable ou non, s'il ne serait pas devenu plus important au cours des dernières années sans qu'on ait modifié les procédures de rassemblement des données pour permettre de l'inclure, si les chiffres se rapportant à des groupes tels que nationaux s'en allant outre-mer, ou étrangers arrivant d'outre-mer en troisième classe, ne seraient pas, dans certains cas particuliers, en étroite corrélation avec ceux qui correspondent aux émigrants ou immigrants permanents tels qu'ils sont définis ci-dessus, etc.

Au paragraphe 19 des *Recommandations,* on distingue les sous-catégories suivantes de visiteurs, suivant le but de leur visite:

(i) Visiteurs en transit
(ii) Visiteurs en vacances
(iii) Visiteurs pour études
  (a) professeurs recrutés par des établissements d'enseignement du pays
  (b) étudiants suivant dans le pays les cours réguliers d'un établissement d'enseignement
  (c) autres visiteurs à des fins d'études (par exemple voyage d'étude, cours d'été)
(iv) Visiteurs pour affaires
(v) Autres visiteurs

Au paragraphe 20 des *Recommandations,* il est indiqué qu'une distinction entre travailleurs et non travailleurs devrait être faite pour le trafic frontalier.

Ces deux classifications plus détaillées sont utiles à diverses catégories d'usagers des statistiques et sont reproduites dans le tableau 39. D'une manière générale, elle ne concernent pas les données fondamentales qui sont nécessaires pour interpréter les chiffres relatifs aux catégories les plus importantes, celles des émigrants et immigrants permanents; il n'est donc pas nécessaire de leur consacrer ici de plus amples développements.

Origine des données

Les renseignements contenus dans les tableaux 39 à 43 ont été obtenus généralement au moyen d'un questionnaire adressé aux gouvernements par le Bureau international du Travail. Des informations complémentaires ont été extraites de publications et documents officiels par le Secrétariat.

Dans les différents pays, les statistiques ont des origines diverses; celles-ci sont indiquées dans les tableaux 40 à 43 par des chiffres romains, suivant un code qui est également utilisé dans l'*Annuaire des statistiques du travail* du Bureau international du Travail. Ce code n'indique pas le degré de confiance qu'on peut avoir dans les statistiques suivant leur source. La classification de ces sources et leurs numéros de code sont les suivants:

I. Statistique des ports, fournies par les services de la marine ou de l'aviation et basées sur les manifestes des navires ou aéronefs ou sur d'autres documents administratifs produits par les compagnies de navigation ou, dans certains cas, sur des fiches individuelles remplies par chaque voyageur ou par les chefs de familles se déplaçant en groupe.

II. Statistiques du contrôle aux frontières, fournies par les services de police ou d'immigration assurant la surveillance des entrées et sorties. Dans certains cas, les données sont obtenues à partir de fiches individuelles.

III. Statistiques basées sur des fiches détachées, aux points de sortie ou d'entrée, de document d'identité délivré aux migrants par les autorités de leur pays.

IV. Statistiques des passeports qui représentent le nombre des passeports délivrés à certaines catégories de futurs voyageurs et ne peuvent renseigner que sur l'émigration des nationaux.

V. Statistiques des registres locaux de population, fournies par les services chargés de la tenue des registres et basées sur les transcriptions de déclarations de changement de résidence que la législation de certains pays a rendues obligatoires.

VI. Autres statistiques, y compris celles qui sont obtenues au cours de l'application des règlements sur l'immigration, les permis de travail requis des étrangers, les contrats de transport pour les émigrants, etc.

La diversité des origines de statistiques sur les mouvements internationaux de populations correspond, dans une certaine mesure, aux variations que présentent les définitions qui ont été analysées au début de la section précédente. Cette diversité complique l'interprétation des différentes séries statistiques dont on peut disposer pour

[36] A cet égard les *Recommandations* de 1953 diffèrent du *Projet de recommandations concernant l'amélioration des statistiques des migrations internationales* de 1949 et des *Résolutions* de la Conférence internationale sur les statistiques des migrations de 1932; mais elles sont conformes aux propositions présentées en 1932 par le Bureau international du Travail.

un même pays ainsi que l'établissement des comparaisons internationales. L'uniformisation des méthodes de rassemblement des données représenterait donc un progrès. Au paragraphe 13 des *Recommandations,* la préférence est nettement donnée aux données recueillies à l'occasion du contrôle aux frontières, pour tous les pays à l'exception du petit nombre de ceux où des statistiques satisfaisantes sur les mouvements internationaux de populations peuvent être obtenues sur la base de registres de population existant déjà. L'application de cette disposition serait rendue plus facile par la conclusion d'arrangements pour le rassemblement en commun des statistiques en question par des pays voisins ou apparentés. Le paragraphe 14 des *Recommandations* attire l'attention des gouvernements sur ce point.

Les données contenues dans les tableaux 40 à 43 se répartissent de la manière suivante suivant leur origine:

		Fréquence[1]		
Code	*Origine des statistiques*	*Totale*	*Pays d'Europe*	*Pays hors d'Europe*
I et II	Ports et contrôle aux frontières	15	3	12
III	Fiches détachées de document d'identité	2	2	–
IV	Passeports délivrés	3	3	–
V	Registres locaux de population	9	7	2
VI	Autres sources	6	4	2
. . .	Source non indiquée	4	–	4
		39	19	20

[1] Le tableau contient des renseignements sur 36 pays. Un pays d'Europe utilise trois sources de statistiques; un autre pays, deux sources. Lorsque c'était à la suite d'une modification des méthodes suivies pour recueillir les données que plusieurs sources étaient indiquées, seule la source employée au cours des années les plus récentes a été comptée.

Le tableau montre que, hors d'Europe, les statistiques des migrations proviennent dans soixante dix pour cent des cas de sources assez sûres, contrôle aux ports et aux frontières, registres de population. En Europe, les statistiques ont les origines les plus diverses; c'est là une manifestation des difficultés particulières qu'on rencontre pour recueillir des renseignements sur les migrations dans un continent où il existe des frontières très nombreuses traversées chaque année par un grand nombre de voyageurs.

Le tableau précédent n'est pas directement comparable à celui qui a été publié dans l'Introduction de l'édition de 1948 de l'*Annuaire démographique.* Une première différence tient à ce que la nomenclature des origines des statistiques ne comprend maintenant que six classes, au lieu de sept en 1948. Les contrats de transport constituaient auparavant la classe IV; ils sont maintenant compris parmi les "autres sources". Deuxième différence, en 1948 les fréquences se rapportaient à 45 pays dont 28 figuraient sur un tableau général sur les migrations continentales et intercontinentales, qui n'est plus publié dans l'*Annuaire,* et 17 sur quatre tableaux correspondant aux tableaux 40 à 43 de la présente édition, où 36 pays sont maintenant inclus. Si, tenant compte de ces différences, on compare le tableau publié en 1948 avec le tableau ci-dessus on constate qu'il n'y a pas eu de progrès sensible dans le sens de l'uniformisation des méthodes utilisées pour recueillir les statistiques des migrations dans les divers pays, particulièrement en Europe ou le problème est le plus sérieux.

Les fréquences des méthodes I et II ont été groupées dans le tableau précédent, parce que les données obtenues par ces deux méthodes sont souvent comparables. D'une manière générale, on ne peut tirer de la simple indication de l'origine des statistiques des migrations aucune conclusion décisive sur leur qualité. Il est nécessaire d'analyser suffisamment en détail les méthodes de rassemblement utilisées pour déterminer les insuffisances qui pourraient résulter de l'emploi de ces méthodes. En outre, pour que les statistiques soient comparables entre pays, il n'est pas nécessaire que les méthodes en question soient identiques; il faut qu'elles soient équivalentes. Dans un pays dont le territoire est une île, les statistiques des ports peuvent donner des résultats comparables aux statistiques du contrôle aux frontières dans un pays qui n'a que des frontières terrestres. Ce dernier genre de données peut, sous certaines conditions, être comparables aux statistiques provenant des registres locaux de population. Seule une étude détaillée de chaque cas peut révéler la valeur des chiffres et indiquer jusqu'à quel point ceux qui se rapportent à différentes périodes de temps et à différents pays peuvent être comparables entre eux.

Précision des données

En plus des insuffisances qui résultent des méthodes de rassemblement et des systèmes de définitions, les statistiques des mouvements internationaux de populations et des migrations sont encore affectées d'erreurs commises au moment où les renseignements fûrent recueillis et au cours de leur exploitation. La précision des statistiques des migrations se trouve être, en outre, limitée par deux facteurs qu'on ne rencontre pas dans le cas des autres statistiques démographiques. Tout d'abord, les définitions de l'émigrant et de l'immigrant permanent sont basées sur des intentions exprimées par les voyageurs et ceux-ci peuvent ultérieurement modifier leurs plans. Deuxièmement, on sait que certaines frontières sont traversées clandestinement; les déplacements correspondant échappent à tout enregistrement statistique, sauf peut-être dans un très petit nombre de cas où des dispositions ont été prévues pour inclure les personnes en cause dans la statistique lorsque leur situation vient à être régularisée.

On ne peut pas vérifier effectivement la précision des statistiques des migrations permanentes d'un pays particulier en examinant dans quelle mesure on peut les recouper en partant des résultats d'ensemble des recensements de population effectués de temps en temps et des différences entre les nombres de naissances et de décès que fournit la statistique de l'état-civil. Cette procédure est inutilisable dans la plupart des cas étant donné que, par rapport à l'accroissement naturel et au total de la population, le chiffre des migrations nettes est en général assez petit pour tomber dans les limites de l'erreur absolue des statistiques des recensements et de l'état civil, même quand la précision relative de ces dernières est assez satisfaisante.

Il demeure possible de déceler certaines erreurs des données sur les migrations à travers les irrégularités

inexpliquées que révèle une comparaison des chiffres relatifs à une série d'années.

On ne peut recompter les voyageurs et les migrants au point de leur itinéraire où les statistiques ont été recueillies une première fois par un pays donné; mais les migrants sont généralement dénombrés tant par le pays de leur précédente résidence permanente que par celui de leur résidence permanente prévue. Ce double dénombrement offre évidemment un moyen de se rendre compte du degré de précision des statistiques des migrations. Toutefois, quand on veut comparer le nombre d'émigrants se rendant dans un pays I, relevé par un pays E, et le nombre d'immigrants venant du pays E, relevé par le pays I, il est nécessaire de prendre quelques précautions. Pour que les deux chiffres coïncident, il faudrait que les données soient parfaitement comparables. Il n'y a donc pas lieu d'être surpris si les chiffres qui se correspondent dans les tableaux 40 et 41 présentent des différences. Par lui-même, ce fait ne signifie pas que la validité et la comparabilité des données soient réduites au point d'être inutilisables. Pour que les chiffres relatifs à l'émigration et à l'immigration qui se correspondent soient égaux, même approximativement, pour deux pays quelconques, des conditions nombreuses et difficiles devraient être remplies. Les principales sont: équivalence des méthodes par lesquelles les données sont recueillies ainsi que des définitions de l'émigrant et de l'immigrant dans tous les pays et compatibilité des listes respectives de pays de résidence permanente prévue et précédente. Des conditions moins fondamentales devraient encore être satisfaites, tels que relevé des personnes changeant de destination en route, des naissances et décès survenant en cours de voyage, ajustement des données pour le décalage entre les moments où les questions sont posées aux migrants à chacun des deux endroits où les données sont recueillies, de manière à tenir compte des voyages qui ne sont pas à la fois commencés et terminés pendant l'année civile considérée. Cependant, même si les conditions précédentes ne sont pas toutes remplies, les données peuvent servir à beaucoup d'usages pour lesquels il suffit d'un moindre degré de comparabilité internationale.

Sur le tableau ci-après figurent des couples de chiffres, pris respectivement sur les tableaux 40 et 41, se rapportant à des mouvements migratoires ayant eu lieu entre certains pays pendant l'année 1952. Les pays choisis présentent une certain importance comme pays d'émigration ou d'immigration. On constate que l'accord entre chiffres correspondant est plus ou moins bon suivant les pays considérés. Dans bien des cas, un examen attentif des définitions présentées dans les tableaux 39 à 41 permet de rendre compte des différences observées.

DESCRIPTION DES TABLEAUX

Tableau 39

Les nombres de voyageurs internationaux, classés suivant les catégories principales de sorties et d'entrées, sont présentés dans le tableau 39 pour les années 1948-1953 et pour 62 pays ou territoires. Le caractère fondamental et l'importance de cette statistique ont été soulignés au paragraphe 8 des *Recommandations* dans les termes suivants: "Pour que les statistiques [des migrations] soient dignes de foi et comparables, il serait très opportun que les totaux des entrées et des sorties soient décomposés en catégories principales. L'interprétation des statistiques pour un pays donné devient tout de suite plus claire lorsque les chiffres pour différentes catégories d'entrées et de sorties peuvent être comparés, tout particulièrement sur un certain nombre d'années. Il devient alors possible d'évaluer l'importance de certains groupes de personnes qui ne sont pas classées de façon uniforme dans les différents pays, ce qui permet, avec un minimum de frais, d'arriver à un certain degré de comparabilité internationale. L'utilisation de ces statistiques concurremment avec les

autres données démographiques (recensements et statistiques de l'état civil) s'en trouve également facilitée."

Catégories principales

Les catégories principales de sorties et d'entrées qui figurent au tableau 39 sont conformes à la nomenclature, décrite ci-dessus, qui a fait l'objet de recommendations internationales. Pour ménager la place, on n'a pas reproduit le libellé complet des catégories principales et on n'a pas mentionné les catégories pour lesquelles on ne disposait d'aucune donnée pour un pays particulier. Dans la mesure du possible, on a indiqué en note, pour les différents pays, des définitions plus détaillées; elles concernent en particulier les termes d'émigrant et immigrant "permanent " et "temporaire". Sauf indication contraire, les chiffres du tableau se rapportent à la fois aux voyageurs nationaux et étrangers et aux déplacements continentaux et intercontinentaux, conformément aux dispositions du paragraphe 17 des *Recommandations.*

En l'absence d'une autre définition, on doit présumer que sur la même ligne que le nom du pays figure le total des sorties ou des entrées de voyageurs internationaux, non compris le trafic frontalier. En vue de faciliter la lecture du tableau, ces chiffres ont toujours été imprimés en caractères gras, qu'il ait été ou non possible de les ventiler suivant les catégories principales.

Cas spéciaux

Conformément au paragraphe 17 des *Recommandations,* les chiffres relatifs aux cas spéciaux sont en général compris dans ceux qui se rapportent à une des catégories principales figurant au tableau 39. Les quelques exceptions à cette règle sont signalées en note ou ressortent à l'examen du tableau du fait que celui-ci ne comporte, pour le pays et l'année considérés, aucune catégorie principale susceptible d'inclure les cas spéciaux. Dans certains cas, plusieurs rubriques figurent parmi les cas spéciaux parce qu'elles présentent un intérêt particulier à différents points de vue; comme un total pour l'ensemble de ces rubriques n'aurait en général pas de signification, il n'a pas été tiré et le signe "non applicable" (.) a été mis à sa place.

Insuffisances des données

Etant donné que le tableau 39 contient celles des statistiques relatives aux mouvements internationaux de populations, figurant dans l'*Annuaire,* qui ont la portée la plus large, il n'y a guère à ajouter aux observations présentées ci-dessus sur les insuffisances de ces statistiques en général. Le tableau lui-même met en évidence l'absence de données pour bien des pays et le fait qu'on ne dispose pas toujours de séries complètes pour toutes les années et pour toutes les catégories de la nomenclature. On voit que suivant la catégorie principale, le nombre de pays figurant au tableau varie beaucoup. Ainsi, on a des chiffres sur le trafic frontalier pour 6 pays seulement; mais sur l'émigration ou l'immigration permanente, on en a pour 26 pays. Les notes font apparaître des exceptions à l'emploi des définitions-types, telles que l'exclusion des nationaux ou des étrangers, des migrants continentaux ou intercontinentaux. Toutes ces insuffisances limitent la valeur des données pour l'interprétation des séries statistiques d'un pays particulier et pour l'établissement des comparaisons internationales. Il est toutefois nécessaire dévaluer dans chaque cas l'importance numérique des limitations pour savoir quel poids il convient de leur attribuer.

Pour la catégorie des visiteurs en vacance, qui correspond aux voyages touristiques, on trouvera des chiffres plus détaillés dans le tableau 141 de l'*Annuaire statistique 1954* publié par les Nations Unies. Ces chiffres et ceux du tableau 39 n'ont la même origine et il existe entre eux des différences parfois importantes.

Tableau 40

Ce tableau contient les statistiques de l'émigration de 28 pays ou territoires, classées suivant le pays ou territoire de résidence permanente prévue, pour les années 1950-1953. Pour gagner de la place, on a mis en note les données très incomplètes relatives à 3 autres pays. De manière à prolonger des séries publiées dans les éditions précédentes de *l'Annuaire démographique,* on a inclus dans le tableau des chiffres pour les anneés 1947-1949 qui n'étaient pas disponibles auparavant.

Définition et origine des données

Le total général des sorties d'émigrants ou de voyageurs, pour un quelconque des pays d'émigration figurant au tableau 40, peut dans presque tous les cas être facilement repéré sur le tableau 39 et ainsi rattaché à une catégorie principale de sortie. Comme les définitions et autres particularités des catégories principales sont indiquées au tableau 39, elles ne sont pas reproduites dans le tableau 40. Les différences qui existent dans quelques cas entre chiffres qui se correspondent dans les deux tableaux ont été signalées dans les notes du tableau 40; presque toujours elles ont pu être expliquées.

Faute de statistiques se rapportant aux émigrants permanents, on a inclus dans le tableau 40, pour certains pays, des chiffres représentant l'ensemble des sorties classées par pays de destination. Sauf indication contraire figurant au tableau 40, on doit présumer que les données sont classées suivant le pays de résidence permanente prévue; les différentes définitions du mot "permanent" résultent de celles qui sont données au tableau 39 pour l'émigrant et l'immigrant permanent.

Le chiffre romain placé après le nom de chaque pays indique l'origine ou méthode de rassemblement des données, comme il est expliqué plus en détail à la page 87.

Migrations continentales et intercontinentales

Les pays ou territoires de résidence prévue continuent à être groupés par continent dans la colonne d'entrée du tableau 40; les pays ou territoires d'émigration ont été maintenant arrangés de la même manière. Avec cette disposition, les données relatives aux migrations ayant lieu à l'intérieur d'un même continent, ou entre deux continents particuliers, forment un bloc facile à repérer. Un tableau sur les migrations continentales et intercontinentales figure également dans l'*Annuaire des statistiques du travail* publié par le Bureau international du Travail. Dans ce tableau, on distingue entre nationaux et étrangers; mais les pays ou continents de résidence prévue n'apparaissent pas. Les totaux correspondants dans le tableau 40 et dans l'*Annuaire des statistiques du travail* coïncident généralement; on peut expliquer les différences en comparant les définitions qui accompagnent chacun des deux tableaux.

Lorsque les migrations continentales ne sont pas comprises dans une série—on peut le savoir en se reportant au tableau 39 comme il est expliqué ci-dessus—le signe "non applicable" (.) a été utilisé dans le tableau 40 pour tous les pays de résidence permanente prévue appartenant au même continent que le pays d'émigration considéré. On a suivi une règle analogue quand ce sont les migrations intercontinentales qui sont exclues des données.

Groupes résiduels

Conformément au paragraphe 28 des *Recommendations,*[37] une rubrique distincte "non spécifié" est ouverte pour chaque continent, en plus de celle intitulée "continent inconnu" qui comprend les émigrants pour lesquels on ne connaît pas la résidence prévue. Avec cette présentation, l'interprétation des sous-totaux par continent est rendue plus facile et les blocs de chiffres relatifs à chaque continent se suffisent à eux-mêmes dans toute la mesure permise par les renseignements dont on dispose. La rubrique "non spécifié" d'un continent particulier comprend les émigrants pour lesquels on ne connait que le continent de résidence prévue et aussi ceux qui ont l'intention de s'établir dans des pays qui ne figurent pas au tableau 40 faute de place. Lorsque le nombre de ces derniers est important, il a été donné en note.

Données groupées

Il arrive que des chiffres distincts ne soient pas disponibles pour deux ou plusieurs pays de résidence prévus, voisins ou apparentés. Le total pour l'ensemble des pays en cause est alors inscrit pour l'un d'eux et le signe "non disponible" (. . .) pour les autres, avec explications en note. Cette convention a été étendue au cas où l'on ne dispose pas de chiffres distincts pour chacune des rubriques "non spécifié" relatives à deux continents.

Insuffisances des données

Les données du tableau 40 sont sujettes aux imperfections des statistiques des migrations en général, qui ont été analysées ci-dessus. Leur comparabilité internationale se trouve encore diminuée chaque fois qu'on s'est écarté des normes concernant la "résidence permanente prévue". Au lieu de classer les émigrants suivant le pays où ils ont l'intention de s'établir, certains pays se réfèrent seulement au pays de destination du voyage, qui est parfois un pays de transit. Dans un petit nombre de pays, le classement est effectué suivant la nationalité juridique ou par groupe ethnique. Il existe des corrélations entre ces répartitions et celles par pays de résidence prévue; mais elles sont plus ou moins étroites selon les circonstances de lieu et de temps. On ne peut pas les mesurer, sauf dans les cas très rares où l'on dispose à la fois des répartitions suivant deux ou plusieurs caractéristiques différentes.

[37] "Le classement . . . devrait être déterminé d'après les frontières nationales du moment; voir les 'Recommandations relatives aux recensements de la population à effectuer en 1950 ou vers cette date', dans le *Rapport de la Commission de la population, troisième session* (E/805, annexe A, partie II, paragraphe 5). Les totaux relatifs aux pays . . . qui ne sont pas indiqués séparément devraient être fournis par continent. Les personnes au sujet desquelles on ne dispose d'aucun renseignement devraient constituer un groupe distinct. Le classement par contiment et par pays devrait être établi d'après la *Nomenclature des régions géographiques établie pour les besoins de la statistique* (Nations Unies, Etudes statistiques, série M, No. 1, 1949)."

Tableau 41

Ce tableau contient les statistiques de l'immigration de 27 pays ou territoires, classées suivant le pays de la précédente résidence permanente, pour les années 1950-1953. Pour gagner de la place, on a mis en note les données très incomplètes relatives à 3 autres pays. Comme dans le tableau 40 et pour les même raisons, on a inclus dans le tableau des chiffres pour les années 1947-1949 qui n'étaient pas disponibles auparavant.

Les observations relatives à la disposition du tableau 40 et aux insuffisances des statistiques qui y sont contenues sont valables pour le tableau 41 si au lieu de sorties, émigrants, pays de résidence permanente prévue et pays de destination, on lit respectivement entrées, immigrants, pays de la précédente résidence permanente et pays de sortie.

Pour un pays, le classement des immigrants est effectué selon le pays de naissance au lieu du pays de la précédente résidence permanente. On ignore si la corrélation entre ces deux répartitions est étroite. A propos du tableau 40, on a rencontré ci-dessus un problème analogue pour les répartitions suivant la nationalité juridique ou par groupe ethnique.

Tableau 42

Les statistiques de 24 pays ou territoires, relatives aux émigrants classés suivant le sexe et l'âge, sont présentées dans le tableau 42 pour les années 1950-1953. Des données classées par sexe ou âge séparément sont incluses seulement quand on ne disposait pas d'une répartition suivant les deux facteurs à la fois. On a placé en note des chiffres pour les années 1947-1949, qui n'étaient pas disponibles auparavant, de manière à prolonger le plus grand nombre possible de séries publiées dans les éditions précédentes de *l'Annuaire démographique* et dans le récent et substantiel ouvrage des Nations Unies intitulé *Migration internationales selon le sexe et l'âge: Statistiques pour les années 1918-1947.*[38]

Définition et origine des données

Le total relatif aux deux sexes, pour un quelconque des pays d'émigration figurant au tableau 42, peut dans presque tous les cas être facilement repéré sur le tableau 39 et ainsi rattaché à une catégorie principale de sorties. Comme les définitions et autres particularités des catégories principales sont indiquées dans le tableau 39, elles ne sont pas reproduites dans le tableau 42. Les différences qui existent dans quelques cas entre les chiffres qui se correspondent dans les deux tableaux ont été signalées dans les notes du tableau 42; presque toujours elles ont pu être expliquées.

Faute de statistiques se rapportant aux émigrants permanents, on a inclus dans le tableau 42, pour certain pays, des chiffres relatifs à l'ensemble des sorties.

Le chiffre romain placé après le nom de chaque pays indique l'origine ou la méthode de rassemblement des données, comme il est expliqué plus en détail à la page 87.

[38] Nations Unies. Département des questions sociales. Etudes démographiques No. 11. No. de vente 1953.IV.15. New York 1953.

Groupes d'âge

Au paragraphe 28(i) des *Recommendations,* la préférence est donnée à l'emploi de groupes d'âge de cinq ans. En général, des groupes de cinq ans ont été utilisés dans le tableau 42 jusqu'à l'âge de 29 ans, des groupes de cinq ou dix ans entre les âges de 30 et 69 ans et un groupe résiduel pour les âges de 70 ans et plus. Toutefois, les usages varient quelque peu entre pays et on a fait figurer sur le tableau 42 des groupes d'âge différents de ceux-là lorsqu'ils étaient les seuls dont on disposât; ceci afin de ne pas réduire par trop le nombre de pays compris dans le tableau. Le nombre d'émigrants dont l'âge n'a pas été relevé est indiqué sous la rubrique âge "inconnu". Dans un petit nombre de cas, le total pour les deux sexes comprend des émigrants dont le sexe n'est pas connu; leur nombre est précisé en note.

Insuffisances des données

Les données figurant au tableau 42 sont sujettes aux insuffisances des statistiques des migrations en général, qui ont été analysées ci-dessus. Leur comparabilité internationale est en outre limitée par l'emploi dans certains pays de groupes d'âge non normalisés et, dans un cas, du fait qu'on a relevé l'âge à l'anniversaire qui suivait le départ au lieu de celui qui le précédait. C'est ce dernier usage qu'on doit présumer avoir été suivi par tous les autres pays; il est le plus fréquent et la préférence lui est donné au paragraphe 28(i) des *Recommandations.*

On ne rencontre guère de difficulté pour faire un classement d'après le sexe. De fait, les cas de sexe inconnu sont rares dans le tableau 42 et les chiffres correspondant sont faibles. Cette observation parait justifier la conclusion que les répartitions par sexe, données dans le tableau, reflètent fidèlement la réalité. Il est toutefois possible que ces répartitions soient moins exactes aux âges jeunes qu'aux âges adultes, étant donné que récemment encore, on ne faisait pas de distinction selon le sexe pour les enfants dans les formulaires statistiques de certains pays, relatifs aux migrations.

Il est à présumer que des erreurs ont été commises lorsque les âges des émigrants ont été relevés. Les chances d'erreur sont faibles lorsque les statistiques sont rassemblées à l'occasion du contrôle aux frontières, puisque la production de papiers d'identité se trouve alors être exigée. D'autre part, certaines des erreurs sont sans effet sur les données du tableau du fait que celles-ci se rapportent à des groupes d'âge assez larges. Les chiffres figurant sous la rubrique âge "inconnu" sont en général peu élevés en pourcentage du nombre total des émigrants considéré. Par contre, ces chiffres sont souvent importants par rapport au nombre d'émigrants d'un même groupe d'âge; on ne peut donc pas négliger la possibilité que les erreurs dans le relevé des âges altèrent sensiblement l'exactitude des chiffres relatifs à certains groupes d'âge. Lorsque la rubrique âge "inconnu" est omise, il ne faut pas conclure que le relevé des âges a été parfait; il se peut que le nombre des personnes d'âge inconnu ait été réparti parmi les différents groupes d'âge, proportionnellement à leur dimension ou suivant quelqu'autre règle. On manque de renseignement précis sur ce point.

Tableau 43

Les statistiques de 21 pays ou territoires, relatives aux immigrants classés suivant le sexe et l'âge, sont présentées dans le tableau 43 pour les années 1950-1953. Des données classées par sexe ou âge séparément sont incluses seulement quand on ne disposait pas d'une répartition suivant les deux facteurs à la fois. Comme dans le tableau 42 et pour les mêmes raisons, on a placé en note des chiffres pour les années 1947-1949 qui n'étaient pas disponibles auparavant.

Les observations relatives à la disposition du tableau 42 et aux insuffisances des statistiques qui y sont contenues sont valables pour le tableau 43 si au lieu de sorties et émigrants on lit respectivement entrées et immigrants.

NOTE ON GEOGRAPHIC AREAS

In so far as possible, the data presented in the *Demographic Yearbook* relate to territorial units within present *de facto* boundaries. Departures from this general rule are noted in the tables, except in a few cases where the difference involved is negligible.

The form of presentation in this Yearbook does not imply official endorsement or acceptance by the United Nations of the status or boundaries of the territories as listed or described. It was adopted solely for the purpose of providing a convenient geographic basis for the accompanying statistical series. The same qualification applies to all notes and explanations concerning the geographic units for which data are presented.

NOTE SUR LES REGIONS GEOGRAPHIQUES

D'une façon générale, les données présentées dans l'*Annuaire démographique* se rapportent au territoire compris à l'intérieur des frontières actuelles *de facto* des unités politiques ou géographiques considérées. Les exceptions à cette règle sont signalées dans les tableaux sauf dans quelques cas où la différence est négligeable.

On ne peut conclure de la présentation adoptée dans cet Annuaire que les Nations Unies approuvent ou reconnaissent officiellement le statut ou les limites des territoires mentionnés. Elle n'a été utilisée que pour donner un cadre géographique aux séries statistiques publiées. La même réserve s'applique également à toutes les notes et explications relatives aux pays qui figurent dans les tableaux.

EXPLANATION OF SYMBOLS

Category not applicable	.
Data not available	...
Magnitude nil (or negligible)	—
Magnitude less than half of unit employed	0 0.0

EXPLICATION DES SIGNES

Données non disponibles	...
Importance nulle (ou négligeable)	—
Importance inférieure à la moitié de l'unité employée	0 0.0

TABLES

TABLEAUX

1. Population, area and density for each part of the world : latest census and midyear estimates of population for 1937, 1952, 1953 and 1954

Population, superficie et densité de chaque partie du monde : dernier recensement et estimations de la population au milieu de l'année pour 1937, 1952, 1953 et 1954

[Unless otherwise noted, data refer to the present-in-area population of the present territory and area figures include inland waters. Figures shown in italics in estimates columns are census counts, and refer to the date of enumeration. For discussion, see page 13.

Sauf indication contraire, les données se rapportent à la population présente sur le territoire actuel et la superficie comprend les eaux intérieures. Les chiffres en italiques dans les colonnes réservées aux estimations sont les résultats de recensements et se rapportent à la date du dénombrement. Voir explications à la page 53.]

* Provisional.
x Unofficial estimate.
[1] See explanation of code at end of table.
[2] Population per square kilometre of area in relation to 1953 or, if not available, 1952 estimate of population.
[3] Population excludes enemy prisoners of war and alien armed forces within country.
[4] Area of inhabited and cultivated territory is 34 815 km², corresponding density is 630.
[5] For 1936.
[6] For non-European population; for European population, type of estimate is A1.
[7] Comprising Algiers, Constantine and Oran (which are Overseas Departments), and the Southern Territory.
[8] *De jure* population including population "comptée à part," i.e., military personnel and persons in institutions.
[9] Non-indigenous population only.
[10] Includes population of area transferred in 1947 to territory of Upper Volta.
[11] Constituted in 1947 from parts of French Sudan, Ivory Coast and Niger.

*Provisoire.
x Estimation non officielle.
[1] Voir explication du code à la fin du tableau.
[2] Population par km² de superficie pour 1953 (ou pour 1952 si aucune estimation n'est disponible pour 1953).
[3] Non compris les prisonniers de guerre et les forces armées étrangères dans le pays.
[4] La superficie habitée et cultivée est de 34 815 km² avec une densité de 630 habitants au km².
[5] Pour 1936.
[6] Pour la population non européenne. Population européenne: A1.
[7] Comprend Alger, Constantine, Oran (départements d'outre-mer) et les Territoires du Sud.
[8] Population de droit y compris la population comptée à part, c'est-à-dire, les militaires et les personnes en prison, dans les hôpitaux et hospices, dans les collectivités religieuses, etc.
[9] Population non indigène seulement.
[10] Y compris la population du territoire rattaché en 1947 à la région de la Haute-Volta.
[11] Constituée en 1947 par la réunion de territoires enlevés au Soudan français, à la Côte d'Ivoire et au Niger.

* Provisional.
x Unofficial estimate.
1 See explanation of code at end of table.
2 Population per square kilometre of area in relation to 1953 or, if not available, 1952 estimate of population.
5 For 1936.
9 Non-indigenous population only.
12 Excluding dependencies: Ile Nossi-Bé, Iles Sainte-Marie, Iles Glorieuses, Iles Saint-Paul, Amsterdam, Marion, Archipel Crozet, Archipel de Kerguélen and Terre Adélie.
13 Associated State. Data for non-Moroccan population exclude military personnel in barracks.
14 *De jure* population.
15 Moroccan Moslem population only. The Moroccan Jewish population and the non-Moroccan population numbered 199 156 and 362 814 respectively according to censuses taken 15 April 1951. The non-Moroccan population appears to have been somewhat underenumerated.
16 Overseas Department.
17 Associated State.
18 Comprising Alhucemas, Chafarinas and Penon de Velez de la Gomera.
19 Including Corisco and Elobeys.
20 Includes nomads who are absent during the dry winter season.

* Provisoire.
x Estimation non officielle.
1 Voir explication du code à la fin du tableau.
2 Population par km² de superficie pour 1953 (ou pour 1952 si aucune estimation n'est disponible pour 1953).
5 Pour 1936.
9 Population non indigène seulement.
12 Non compris les dépendances: île Nossi-Bé, îles Sainte-Marie, îles Glorieuses, îles Saint-Paul, Amsterdam, Marion, Archipel Crozet, Archipel de Kerguélen et Terre Adélie.
13 Etat associé. Les données relatives à la population non marocaine ne comprennent pas les militaires dans les casernes.
14 Population de droit.
15 Marocains musulmans seulement. Les Marocains israélites et les non-marocains s'élevaient à 199 156 et à 362 814 respectivement aux recensements du 15 avril 1951. Les résultats du recensement de la population non marocaine sont considérés comme inférieurs à la réalité.
16 Département d'outre-mer.
17 Etat associé.
18 Comprennent Alhucemas, Chafarinas et Penon de Velez de la Gomera.
19 Y compris Corisco et Elobeya.
20 Y compris les nomades absents pendant la saison sèche qui tombe en hiver.

x Unofficial estimate.
1 See explanation of code at end of table.
2 Population per square kilometre of area in relation to 1953 or, if not available, 1952 estimate of population.
9 Non-indigenous population only.
21 Includes 282 persons in Mafeking, the capital, which is located in the Union of South Africa, and 14 119 civilian nationals outside the territory. Excludes nomad population, estimated at 20 000.
22 Colony and Protectorate. Population excludes temporary labourers from other areas, numbering 15 042 in 1951.
23 In Colony only. The 1951 annual "enumeration" of the Protectorate showed a population of 252 389.
24 In Protectorate only.
25 Colony and Protectorate.
26 Excludes population of Northern Frontier Province and parts of Rift Valley, estimated at 219 000. Civilian population, excluding 4 137 persons in transit and 188 Polish refugees in camps.
27 Excluding dependencies, shown separately below.
28 Comprising Diego Garcia, Peros Banhos, Agalega, Solomon and St. Brandon.
29 African population only based on sample census. Non-African population, enumerated 8 May 1951, numbered 40 715.
30 Including the dependency of Ascension but excluding Tristan de Cunha (area: 98 km²; estimated population at midyear 1952: 281 persons) and the uninhabited islands, Gough, Inaccessible and Nightingale.
31 Colony and dependencies, comprising 92 islands.
32 Excludes approximately 700 men on military service overseas.
33 In Colony only. This census and test counts in the Protectorate in June 1948 gave a total population of 1 858 275.
34 African population indigenous to Southern Rhodesia based on sample census. Non-African population enumerated 8 May 1951 numbered 145 879.
35 Excludes 4 020 Polish refugees in camps and 209 persons in transit.
36 Excludes Polish refugees in camps and persons in transit.

x Estimation non officielle.
1 Voir explication du code à la fin du tableau.
2 Population par km² de superficie pour 1953 (ou pour 1952 si aucune estimation n'est disponible pour 1953).
9 Population non indigène seulement.
21 Y compris 282 personnes se trouvant à Mafeking, la capitale, située en Union Sud-Africaine et environ 14 119 civils nationaux hors du pays. Non compris les nomades estimés à 20 000.
22 Colonie et protectorat. Non compris les ouvriers temporaires venant d'autres régions, estimés à 15 042 en 1951.
23 Colonie seulement. Le "dénombrement" annuel du protectorat de 1951 a indiqué une population de 252 389 habitants.
24 Protectorat seulement.
25 Colonie et Protectorat.
26 Non compris les provinces frontalières du Nord et une partie de la Vallée du Rift avec une population estimée à 219 000 habitants. Population civile, non compris 4 137 personnes de passage et 188 réfug.és polonais dans des camps.
27 Non compris les dépendances qui figurent séparément ci-dessous.
28 Comprennent Diego Garcia, Peros Banhos, Agalega, Solomon et St.-Brandon.
29 Population africaine seulement. Recensement par sondage. Le recensement de la population non africaine du 8 mai 1951 a donné le total de 40 715 personnes.
30 Comprend la dépendance d'Ascension mais non Tristan da Cunha (98 km², population estimée au milieu de l'année 1952 à 281 personnes) et les îles inhabitées de Gough, Inaccessible et Nightingale.
31 Colonie et dépendances, comprenant 92 îles.
32 Non compris environ 700 militaires servant outre-mer.
33 Colonie seulement. Ce recensement et des "comptages" effectués dans le Protectorat en juin 1948 ont indiqué une population totale de 1 858 275 habitants.
34 Population africaine indigène de la Rhodésie du Sud. Recensement par sondage. Le recensement de la population non africaine du 8 mai 1951 a donné le total de 145 879 personnes.
35 Non compris 4 020 réfugiés polonais dans des camps et 209 personnes de passage.
36 Non compris les réfugiés polonais dans des camps et les personnes de passage

Greenland [41] — Groenland [41]	31 XII 1951	24 015	A..	18	24	25	...	[42] 2 175 600	0

* Provisional.
x Unofficial estimate.
[1] See explanation of code at end of table.
[2] Population per square kilometre of area in relation to 1953 or, if not available, 1952 estimate of population.
[9] Non-indigenous population only.
[14] *De jure* population.
[37] Excludes armed forces and 5 397 Polish refugees in camps.
[38] Excludes adjustment for underenumeration (136 860).
[39] Excluding data for Canal Zone shown separately below.
[40] *De jure* population, but excluding civilian citizens of continental US absent from the country for extended periods of time. Census figure also excludes an estimated 435 000 members of the armed forces outside continental US at time of census.
[41] On 5 June 1953 Greenland became a department of Denmark.
[42] Area of ice-free portion is 341 700 km².

* Provisoire.
x Estimation non officielle.
[1] Voir explication du code à la fin du tableau.
[2] Population par km² de superficie pour 1953 (ou pour 1952 si aucune estimation n'est disponible pour 1953).
[9] Population non indigène seulement.
[14] Population de droit.
[37] Non compris les forces armées et 5 397 réfugiés polonais dans des camps.
[38] Non compris un ajustement pour compenser les lacunes du recensement (sous-estimation évaluée à 136 860 personnes).
[39] Non compris la Zone du Canal qui figure séparément ci-dessous.
[40] Population de droit, non compris les civils citoyens des Etats-Unis continentaux absents du pays pour de longues périodes. Le chiffre du recensement ne comprend également pas environ 435 000 militaires hors des Etats-Unis continentaux lors du recensement.
[41] Le Groenland est un département danois depuis le 5 juin 1953.
[42] La superficie non occupée par les glaces est de 341 700 km².

* Provisional.
[x] Unofficial estimate.
[1] See explanation of code at end of table.
[2] Population per square kilometre of area in relation to 1953 or, if not available, 1952 estimate of population.
[14] *De jure* population.
[54] For 31 December.
[62] For 1948.
[63] Comprising islands of Taiwan and Pescadores.
[64] Excludes foreigners.
[65] Including Sikkim, Andaman and Nicobar Islands, and Laccadive Islands. Also including Kashmir-Jammu, the political status of which is not yet determined (area: 240 291 km²; population estimated at 4.41 millions at 1 March 1951).
[66] Excludes Kashmir-Jammu and the tribal areas of Assam (population of the latter locally estimated at 560 630 persons.) *De jure* population.
[67] Excludes nomad population estimated at 250 000 at time of census.
[68] Jewish population only.
[69] For Jewish population; for Moslem population type of estimate is D..
[70] Comprising Hokkaido, Honshu, Shikoku, Kyushu and small outlying islands; also including the Tokara Islands (southern Jitto Son) transferred to Japan from the Ryukyu Islands on 5 December 1951 under the terms of the Japanese Peace Treaty, and the Amami Islands transferred to Japan from the Ryukyu Islands on 25 December 1953. Data exclude the Amami Islands (population 216 110 at census taken 1 December 1950 and area 1 221 km²) and, except 1952-1953 estimates, also exclude southern Jitto Son (population 2 938 at census taken 1 December 1950 and area approximately 331 km²).
[71] For 1 October.
[72] Excludes Allied military and civilian personnel and their dependents.
[73] Including West Jordan (i.e., the part of Arab Palestine annexed 24 April 1950). Population excludes military personnel and their families living on military installations.
[74] Population excludes foreigners, numbering 21 885 at 1949 census.
[75] For 1954; for 1952 and 1953, type of estimate is D0.
[76] For 1 June.
[77] Lebanese nationals only.
[78] Mongolian population only, in area excluding Kobdo district and the possessions of Bogdo-Gegen. Total population at time of census unofficially estimated at 647 500 persons.
[79] Excluding Kashmir-Jammu, Gilgit, Baltistan, Junagadh and Manavadar.
[80] Excludes large river areas in East Bengal (approximately 930 km²).

* Provisoire.
[x] Estimation non officielle.
[1] Voir explication du code à la fin du tableau.
[2] Population par km² de superficie pour 1953 (ou pour 1952 si aucune estimation n'est disponible pour 1953).
[14] Population de droit.
[54] Au 31 décembre.
[62] Pour 1948.
[63] Comprend les îles de Taïwan et des Pescadores.
[64] Non compris les étrangers.
[65] Y compris Sikkim, et les îles Andaman, Nicobar et Laccadive. Y compris également le Cachemire-Jammu dont le statut politique n'est pas encore déterminé (240 291 km², population estimée à 4 410 000 habitants au 1er mars 1951).
[66] Non compris le Cachemire-Jammu et la zone de tribus d'Assam (population estimée sur place à 560 630 personnes). Population de droit.
[67] Non compris les nomades estimés à 250 000 au moment du recensement.
[68] Population juive seulement.
[69] Pour la population juive. Population musulmane: D..
[70] Comprend Hokkaido, Honshu, Shikoku, Kyu-Shu et les petites îles adjacentes. Comprend, aussi les îles Tokara (partie méridionale du groupe des îles Jitto Son) détachées des îles Ryû-Kyû aux termes du Traité de Paix avec le Japon du 5 décembre 1951 et les îles Amami également détachées des îles Ryû-Kyû et rendues au Japon le 25 décembre 1953. Les îles Amami (216 110 habitants au recensement du 1er décembre 1950 et 1 221 km²) et, à l'exception des estimations pour 1952–1953, la partie méridionale des îles Jitto Son (2 938 habitants au recensement du 1er décembre 1950 et 331 km²), ne sont pas comprises dans les données.
[71] Au 1er octobre.
[72] Non compris les militaires et civils alliés ainsi que les personnes à leur charge.
[73] Y compris la Jordanie de l'ouest (c'est-à-dire, la partie de la Palestine arabe annexée le 24 avril 1950). Non compris les militaires et leurs familles vivant dans des baraquements de l'armée.
[74] Non compris les étrangers au nombre de 21 885 lors du recensement de 1949.
[75] Pour 1954; 1952 et 1953: DO.
[76] Au 1er juin.
[77] Nationaux libanais seulement.
[78] Population mongole seulement sur un territoire ne comprenant pas le district de Kobdo et les possessions de Bogdo-Gegen. L'estimation non officielle de la population totale établie au moment du recensement est de 647 500 personnes.
[79] Non compris le Cachemire-Jammu, le Gilgit, le Bultistan, le Junagadh et le Manavadar.
[80] Non compris de vastes régions fluviales dans le Bengale oriental (environ 930 km²).

* Provisional.
x Unofficial estimate.
1 See explanation of code at end of table.
2 Population per square kilometre of area in relation to 1953 or, if not available, 1952 estimate of population.
54 For 31 December.
71 For 1 October.
81 Population excludes nomads and semi-nomads, estimated at 288 400 in 1945.
82 Excludes population of Hatay, acquired from Syria 29 June 1939.
83 Excludes swamps and lakes with area of 9 861 km².
84 Comprising former Annam, Cochin-China and Tonkin.
85 Comprising Karikal, Mahé, Pondichéry and Yanaon. As of 1 November 1954, the administration of these four settlements was transferred to India.
86 Census of non-indigenous population held on 29 November 1951 gave total of 1 435.
87 Includes Chandernagor which became part of India as of 2 May 1950 (population 44 700 at time of transfer).
88 Comprising Damao, Diu and Gôa.
89 Excludes persons in special military and internment camps, numbering 12 422 at time of census.
90 Civilian population only.
91 Comprising the former Federated Malay States, Unfederated Malay States, and the settlements of Penang and Malacca. Population excludes transients afloat, non-resident military personnel and enemy prisoners of war numbering altogether 14 735 at 1947 census.
92 Excludes 1 442 transients and 66 members of the British armed forces.
93 Excludes population of Labuan, transferred from Straits Settlements in 1946 (population 7 507 at census 1 April 1931).

* Provisoire.
x Estimation non officielle.
1 Voir explication du code à la fin du tableau.
2 Population par km² de superficie pour 1953 (ou pour 1952 si aucune estimation n'est disponible pour 1953).
54 Au 31 décembre.
71 Au 1er octobre.
81 Non compris les nomades et semi-nomades estimés à 288 400 en 1945.
82 Non compris Hatay, cédé par la Syrie le 29 juin 1939.
83 Non compris les marais et les lacs représentant une superficie de 9 861 km².
84 Comprend les anciennes provinces d'Annam, de Cochinchine et du Tonkin.
85 Comprend Karikal, Mahé, Pondichéry et Yanaon. L'administration de ces quatre possessions a été remise à l'Inde le 1er novembre 1954.
86 Un recensement de la population non indigène effectué le 29 novembre 1951 a donné le total de 1 435 personnes.
87 Y compris Chandernagor qui fait partie de l'Inde depuis le 2 mai 1950 (44 700 habitants au moment du transfert).
88 Comprend Damao, Diu et Gôa.
89 Non compris les personnes dans des camps militaires et d'internement s'élevant à 12 422 lors du recensement.
90 Population civile seulement.
91 Composée des anciens états malais fédérés et non fédérés ainsi que des établissements de Penang et Malacca. Non compris les passagers à bord des navires, les militaires non résidents et les prisonniers de guerre ennemis s'élevant ensemble à 14 735 personnes au recensement de 1947.
92 Non compris 1 442 personnes de passage et 66 militaires britanniques.
93 Non compris le Labuan détaché des Etablissements des Détroits en 1946 (7 507 habitants au recensement du 1er avril 1931).

2 Population per square kilometre of area in relation to 1953 or, if not available, 1952 estimate of population.
14 *De jure* population.
72 Excludes Allied military and civilian personnel and their dependents.
94 Population excludes transients afloat, non-resident military personnel and enemy prisoners of war, numbering altogether 36 015 at 1947 census.
95 Excludes British military personnel, numbering 2 507 at 1931 census.
96 Comprising the part of Palestine not included in Israel or Jordan and currently under Egyptian administration.
97 Comprising Parry, Beechey, Bailey, Volcano and Marcus Islands.
98 Population 139 in 1952 and 151 in 1953.
99 Comprising those islands of the Ryukyu group south of the 29th degree of North latitude except the Amami Islands which were transferred to Japan on 25 December 1953. Data include the Amami Islands (population: 216 110 at 1950 census and 201 753 at 30 June 1953; area: 1 221 km²).
100 Permanent residents only.
101 Excludes population of Southern Dobruja, ceded by Romania in 1940.
102 Excludes population of Bratislava Bridgehead, ceded by Hungary in 1947 (population 3 379 in 1941).
103 Excluding the Faeroe Islands, shown separately below. Except for 1937, *de jure* population.
104 Finnish nationals in Finland, including merchant seamen at sea.

* Provisoire.
x Estimation non officielle.
1 Voir explication du code à la fin du tableau.
2 Population par km² de superficie pour 1953 (ou pour 1952 si aucune estimation n'est disponible pour 1953).
14 Population de droit.
72 Non compris les militaires et civils alliés ainsi que les personnes à leur charge.
94 Non compris les passagers à bord des navires, les militaires non résidents et les prisonniers de guerre ennemis s'élevant ensemble à 36 015 personnes au recensement de 1947.
95 Non compris les troupes britanniques s'élevant à 2 507 hommes au recensement de 1931.
96 Comprend la partie de la Palestine non rattachée à Israël ou à la Jordanie et qui est administrée par l'Egypte.
97 Comprennent les îles Parry, Beechey, Bailey, Volcan et Marcus.
98 139 habitants en 1952 et 151 en 1953.
99 Formées des îles du groupe Ryû-Kyû qui se trouvent au sud du 29 ème parallèle de latitude Nord à l'exclusion des îles Amami rendues au Japon le 25 décembre 1953. Les données comprennent les îles Amami (216 110 habitants au recensement de 1950 et 201 753 au 30 juin 1953, sur une superficie de 1 221 km²).
100 Résidents permanents seulement.
101 Non compris la Dobroudja méridionale cédée par la Roumanie en 1940.
102 Non compris la tête de pont de Bratislava cédée par la Hongrie en 1947 (3 379 habitants en 1941).
103 Non compris les îles Féroé qui figurent séparément ci-dessous. Population de droit sauf pour 1937.
104 Nationaux finlandais en Finlande, y compris les équipages de la marine marchande en mer.

* Provisional.
x Unofficial estimate.
[1] See explanation of code at end of table.
[2] Population per square kilometre of area in relation to 1953 or, if not available, 1952 estimate of population.
[14] *De jure* population.
[105] Excluding the Saar, shown separately below. Also excluding small border areas (708 km²) ceded by Italy in 1947.
[106] Excludes enemy prisoners of war estimated at 663 000.
[107] Includes allowances of 300 000 for armed forces and 6 000 for merchant seamen outside country at 1946 census.
[108] In territory defined by Treaty of Versailles.
[109] Includes population of the villages of Elten and Tüddern transferred to the Netherlands in 1949 (population approximately 9 000 at time of transfer).
[110] Democratic Republic of Germany comprising the USSR zone of occupation and East Berlin.
[111] Excludes population of East Berlin which numbered *1 189 523 at the census of 31 August 1950.
[112] Federal Republic of Germany comprising the former British, French and US zones of occupation but excluding the Saar.
[113] Includes armed forces outside country but excludes alien armed forces within country.
[114] Excludes population of the Dodecanese, ceded by Italy in 1947.
[115] Includes population of Bratislava Bridgehead, ceded to Czechoslovakia in 1947 (population 3 379 in 1941).
[116] For 1938.
[117] Excludes population of villages of Elten and Tüddern, acquired from Germany in 1949 (population approximately 9 000 at time of transfer).
[118] Land area only; total area up to the low-waterline (sea-level at low tide) is 40 893 km².
[119] In territory of 1923-1937, i.e., including areas ceded to USSR after World War II and excluding Danzig and areas formerly part of Germany.
[120] For 1 March.
[121] Including the Azores and Madeira islands.
[122] Including the Balearic and Canary Islands.

* Provisoire.
x Estimation non officielle.
[1] Voir explication du code à la fin du tableau.
[2] Population par km² de superficie pour 1953 (ou pour 1952 si aucune estimation n'est disponible pour 1953).
[14] Population de droit.
[105] Non compris la Sarre qui figure séparément ci-dessous. A l'exclusion également des petites parcelles de territoire limitrophe (708 km²) cédées par l'Italie en 1947.
[106] Non compris les prisonniers de guerre ennemis estimés à 663 000.
[107] Y compris une évaluation de 300 000 hommes pour les forces armées stationnées en dehors du territoire métropolitain et une de 6 000 pour les équipages de la marine marchande en mer, lors du recensement de 1946.
[108] Population sur le territoire du traité de Versailles.
[109] Y compris les villages d'Elten et de Tüddern cédés aux Pays-Bas en 1949 (environ 9 000 habitants au moment du transfert).
[110] République démocratique allemande formée de la zone d'occupation russe et de Berlin-Est.
[111] Non compris Berlin-Est dont la population était de *1 189 523 habitants au recensement du 31 août 1950.
[112] République fédérale allemande formée des anciennes zones d'occupation anglaise, française et américaine, non compris la Sarre.
[113] Y compris les forces armées nationales hors du pays; non compris les troupes étrangères dans le pays.
[114] Non compris le Dodécanèse cédé par l'Italie en 1947.
[115] Y compris la tête de pont de Bratislava cédée à la Tchécoslovaquie en 1947 (3 379 personnes en 1941).
[116] Pour 1938.
[117] Non compris les villages d'Elten et de Tüddern obtenus de l'Allemagne en 1949 (environ 9 000 habitants au moment du transfert).
[118] Superficie terrestre seulement; la superficie totale (limite des eaux à marée basse) est de 40 893 km².
[119] Territoire de 1923–1937, c'est-à-dire y compris les régions cédées à l'URSS après la Seconde Guerre mondiale et non compris Dantzig et les territoires faisant autrefois partie de l'Allemagne.
[120] Au 1er mars.
[121] Y compris les Açores et îles Madères.
[122] Y compris les îles Baléares et Canaries.

* Provisional.
x Unofficial estimate.
1 See explanation of code at end of table.
2 Population per square kilometre of area in relation to 1953 or, if not available, 1952 estimate of population.
14 *De jure* population.
90 Civilian population only.
123 Excluding Channel Islands and Isle of Man, shown separately below.
124 Includes armed forces overseas but excludes Commonwealth and foreign forces in the country.
125 Area 0.44 km^2.
126 Excludes population of territory ceded by Italy in 1947.
127 Inhabited only during winter season. Norwegian population included in *de jure* population of Norway (estimated at 1 164 in 1950/1951). Russian population unoffcially estimated at 2 600 in 1950.
128 Including dependencies: Alderney, Brechou, Great Sark, Little Sark, Herm, Jethou and Lihou.
129 Including Comino Island.
130 Excludes non-Maltese crews of merchant ships in harbour, numbering 1 005 persons at time of census.
131 British-US Zone (Zone A) of Free Territory. Population of Yugoslav Zone (Zone B), with area of 516 km^2, estimated at 73 500 in 1940. In October 1954, administration of Zone A was transferred to Italy and that of Zone B to Yugoslavia.
132 Population excludes full-blooded aborigines, estimated at 47 000 in 1944.
133 Excludes armed forces outside country, numbering approximately 14 000 at time of census.
134 Including Campbell and Kermadec Islands (population: 19 at 1951 census; area: 148 km^2) but excluding the other minor islands which are uninhabited.

* Provisoire.
x Estimation non officielle.
1 Voir explication du code à la fin du tableau.
2 Population par km^2 de superficie pour 1953 (ou pour 1952 si aucune estimation n'est disponible pour 1953).
14 Population de droit.
90 Population civile seulement.
123 Non compris les îles Anglo-Normandes et l'île de Man, qui figurent séparément ci-dessous.
124 Y compris les forces armées nationales outre-mer et non compris les troupes étrangères et celles du Commonwealth dans le pays.
125 Superficie: 44 hectares.
126 Non compris la population du territoire cédé par l'Italie en 1947.
127 Habités seulement pendant la saison d'hiver. Norvégiens (estimés à 1 164 en 1950/1951) compris dans la population de droit norvégienne. Russes estimés à 2 600 en 1950 (estimation non officielle).
128 Y compris les dépendances: Alderney, Brechou, Grand-Sercq, Petit-Sercq, Herm, Jehou et Lihou.
129 Y compris l'île Comino.
130 Non compris les équipages non maltais des navires marchands dans le port s'élevant à 1 005 hommes lors du recensement.
131 Zone anglo-américaine (Zone A) du territoire libre de Trieste. Population de la Zone yougoslave (Zone B) estimée à 73 500 en 1940 sur un territoire de 516 km^2. En octobre 1954, l'administration de la Zone A a été confiée à l'Italie et celle de la Zone B à la Yougoslavie.
132 Non compris les purs aborigènes estimés à 47 000 en 1944.
133 Non compris les forces armées hors du pays s'élevant à 14 000 hommes environ au moment du recensement.
134 Y compris les îles Campbell et Kermadec (19 habitants au recensement de 1951 sur 148 km^2) mais non compris les îles secondaires qui sont inhabitées.

x Unofficial estimate.
1 See explanation of code at end of table.
2 Population per square kilometre of area in relation to 1953 or, if not available, 1952 estimate of population.
5 For 1936.
9 Non-indigenous population only.
48 *De jure* population, but including US armed forces stationed in the area.
135 Comprising Austral, Gambier, Marquesas, Rapa, Society and Tuamotu Islands.
136 Including dependencies: Wallis, Futuna, Huon and Chesterfield Islands.
137 Comprising the Solomon Islands group except Bougainville and Buka (see New Guinea below); also including Ontung Java, Rennell, and Santa Cruz Islands.
138 Including Christmas, Fanning, Ocean and Washington Islands; also including the Phoenix Island group, of which Canton and Enderbury Islands have been an Anglo-American condominium since 6 April 1939. The population of Canton was 272 at census taken 1 April 1950 under US auspices; Enderbury Island was uninhabited at that time.
139 Population estimated at 125 in 1951.
140 Excludes US military and administrative personnel and their dependents.
141 For 1952.

x Estimation non officielle.
1 Voir explication du code à la fin du tableau.
2 Population par km² de superficie pour 1953 (ou pour 1952 si aucune estimation n'est disponible pour 1953).
5 Pour 1936.
9 Population non indigène seulement.
48 Population de droit y compris les forces armées américaines stationnées dans la région.
135 Comprend les îles Australes, Gambier, Marquises, Rapa, de la Société et Touamotou.
136 Y compris les dépendances: îles Wallis, Futuna, Huon et Chesterfield.
137 Constituent le groupe des îles Salomon à l'exception des îles de Bougainville et de Buka (voir Nouvelle-Guinée ci-dessous). Non compris également les îles Ontung Java, Rennell et Santa Cruz.
138 Y compris les îles Christmas, Fanning, Ocean et Washington. Y compris également le groupe des îles Phoenix parmi lesquelles les îles Canton et Enderbury se trouvent sous un condominium anglo-américain depuis le 6 avril 1939. La population de Canton s'élevait à 272 habitants au recensement du 1er avril 1950, effectué par les autorités américaines; l'île d'Enderbury était inhabitée à cette date.
139 Population estimée à 125 habitants en 1951.
140 Non compris les militaires et fonctionnaires américains ainsi que les personnes à leur charge.
141 Pour 1952.

[1] See explanation of code at end of table.
[2] Population per square kilometre of area in relation to 1953 or, if not available, 1952 estimate of population.
[9] Non-indigenous population only.
[140] Excludes US military and administrative personnel and their dependents.
[142] Comprising Northeast New Guinea, the Bismarck Archipelago, Bougainville and Buka of the Solomon Islands group, and about 600 smaller islands.
[143] Land area only; total, including the ocean area within administrative boundaries, 2 589 900 km².
[144] Comprising the Carolines, Marianas and Marshall Islands, which came under US Trusteeship on 19 July 1947.
[145] Inhabited dry land area only; total, including ocean area within administrative boundaries, approximately 7 769 700 km².
[146] For 31 March.
[147] Census figures refer to 1939 territory. The population of territories annexed during 1939-1940 (Estonia, Latvia and parts of former Lithuania, Czechoslovakia, Finland, Poland and Romania), was estimated at 23 million in 1940. Area figures and estimate refer to present territory, which also includes Tannu-Tuva, Southern Sakhalin and the Kurile Islands, the remainder of former Lithuania, and former parts of Germany.
[148] For 31 December 1951, published by the United Nations Economic Commission for Europe.

TYPE OF ESTIMATE—The code symbols indicate the method by which official estimates of population for the years 1952-1954 were prepared, so far as could be ascertained. The letters R and A to E of the code indicate the nature of the base data; the numerals 0 to 8 indicate the method of time adjustment to other dates. The details of the code classification are given below.

Base data are classified as follows:

R—continuous population registers.
A—census enumerations, the last having been made since 1 January 1950.
B—census enumerations, the last having been made between 1 January 1954 and 1 January 1950.
C—census enumerations, the last having been made prior to 1 January 1945.
D—non-censal counts or partial censuses.
E—conjectural estimates derived by other means than counting.

[1] Voir explication du code à la fin du tableau.
[2] Population par km² de superficie pour 1953 (ou pour 1952 si aucune estimation n'est disponible pour 1953).
[9] Population non indigène seulement.
[140] Non compris les militaires et fonctionnaires américains ainsi que les personnes à leur charge.
[142] Comprend le nord-est de la Nouvelle-Guinée, Bougainville et Buka du groupe des îles Salomon et environ 600 îlots.
[143] Superficie terrestre seulement. La superficie totale comprenant les eaux maritimes se trouvant à l'intérieur des frontières administratives est de 2 589 900 km².
[144] Comprennent les îles Carolines, Mariannes et Marshall sous tutelle américaine depuis le 19 juillet 1947.
[145] Superficie terrestre et habitée seulement. La superficie totale comprenant les eaux maritimes se trouvant à l'intérieur des frontières administratives est de 7 769 700 km² environ.
[146] Au 31 mars.
[147] Les chiffres du recensement se rapportent au territoire de 1939. La population des territoires annexés en 1939–1940 (Estonie, Lettonie et fractions des anciens états lituanien, tchécoslovaque, finlandais, polonais et roumain), était estimée à 23 millions d'habitants en 1940. Les données relatives à la superficie concernent le territoire actuel qui comprend le reste de l'ancienne Lituanie; Tanu-Touva; la partie méridionale de l'île de Sakhaline ainsi que les Kouriles, et certains territoires appartenant autrefois à l'Allemagne.
[148] Au 31 décembre 1951; chiffre publié par la Commission Economique pour l'Europe des Nations Unies.

TYPES D'ESTIMATIONS—Les symboles indiquent la méthode d'aprés laquelle ont été établies les estimations officielles de population pour les années 1952 à 1954, dans la mesure où l'on a pu s'assurer de la méthode utilisée. Les lettres R et A à E du code précisent la nature des données de base; les chiffres 0 à 8 correspondent aux procédés d'adaptation chronologique. La signification des divers éléments du code est donnée ci-dessous.

Les données de base sont classées de la façon suivante:

R—registres permanents de population.
A—recensements, le dernier ayant été effectué après le 1er janvier 1950.
B—recensements, le dernier ayant été effectué entre le 1er janvier 1945 et le 1er janvier 1950.
C—recensements, le dernier ayant été effectué avant le 1er janvier 1945.
D—dénombrements différents d'un recensement ou recensements partiels.
E—évaluations conjecturales obtenues par d'autres moyens que des dénombrements.

1. Population, area and density (continued) — Population, superficie et densité (suite)

[See headnote on page 97. — Voir note explicative à la page 97.]

TYPE OF ESTIMATE—(continued)

Methods of time adjustment are classified as follows:

0—none, base data being secured annually and requiring no time adjustment.
1—substantially accurate statistics of births and deaths, and (where relevant) comprehensive migration statistics.
2—substantially accurate statistics of births and deaths; doubtful or deficient data on migratory movements, or no account taken of such movements.
3—birth and death statistics of undetermined reliability (adequacy of migration data is disregarded).
4—birth and death statistics which are stated to be deficient (adequacy of migration data is disregarded).
5—mathematical extrapolation (or interpolation), at least three censuses having been taken since 1900.
6—mathematical extrapolation (or interpolation), less than three censuses having been taken since 1900.
7—assumed rates of increase not derived by mathematical extrapolation.
8—none, base figure being held constant.
. .—method of adjustment not ascertained.
See page 11 for further explanations.

TYPES D'ESTIMATIONS—(suite)

Les procédés d'adaptation chronoligique sont classés de la façon suivante:

0—aucun, données de base fournies annuellement, adaptation inutile.
1—statistiques relativement exactes des naissances et décès, et (à l'occasion) données assez complètes sur les migrations.
2—statistiques relativement exactes des naissances et décès; données sujettes à caution ou incomplètes sur les mouvements migratoires, ou aucun relevé de ces déplacements de population.
3—statistiques des naissances et décès de qualité inconnue (il n'est pas tenu compte de l'exactitude des données relatives aux migrations).
4—statistiques des naissances et décès signalées comme incomplètes (il n'est pas tenu compte de l'exactitude des données relatives aux migrations).
5—extrapolation ou intrapolation mathématique, trois recensements au moins ayant été effectués depuis 1900.
6—extrapolation ou intrapolation mathématique, moins de trois recensements ayant été effectuès depuis 1900.
7—taux d'accroissement présumés, non dérivés d'une extrapolation mathématique.
8—pas d'adaptation, donnée de base utilisée en permanence.
. .—procédé d'adaptation inconnu.
Voir explications supplémentaires à la page 51.

1.A Population, area and density of continental divisions, by regions : 1920–1953
Population, superficie et densité des continents suivant les régions : 1920–1953

[Figures shown in parentheses are the mid-values of the ranges. For discussion, see page 14.

[1] Estimates include adjustments for underenumeration at various censuses.
[2] Land area including inland waters but excluding certain uninhabited polar regions and some uninhabited islands.
[3] Population (mid-value of range) per km² of area.
[4] Including allowance for the population and area of the USSR.
[5] European Turkey is included with Asia.

[1] Les estimations comprennent des ajustements pour compenser les lacunes de certains recensements.
[2] Superficie terrestre comprenant les eaux intérieures mais pas certaines régions polaires inhabitées et quelques îles désertes.
[3] Population (médiane de l'intervalle) par km² de superficie.
[4] Y compris une estimation de la population et de la superficie de l'URSS.
[5] L'Asie comprend la Turquie d'Europe.

2. Estimates of total population : 1920 – 1954

[Official estimates of population for 1 July or averages of official end-year estimates. Figures shown in italics are census counts and refer to the date of enumeration. For type of estimate, 1952–1954, see Table 1; for discussion, see page 14.]

§ Estimates for last intercensal period not yet revised to accord with census results.

[1] Includes 282 persons in Mafeking, the capital, which is located in the Union of South Africa, and 14 119 civilian nationals outside territory. Excludes nomad population, estimated at 20 000.

[2] European, Indian and Coloured, together comprising about one percent of the total population.

[3] For 31 December.

[4] Excluding enemy prisoners of war and alien armed forces within the country.

[5] Excluding temporary labourers from other areas, numbering 15 042 in 1951.

[6] *De jure* population.

[7] "Non-Moroccan", excluding military personnel in barracks.

[8] Based on ration count of September 1950.

[9] Fluctuations 1943–1947 believed attributable to incomplete registration, famine and emigration.

[10] Former mandated territory (Union of South Africa).

[11] During war years, including armed forces outside country, and excluding enemy prisoners of war numbering 27 898 in 1946.

2. Estimations de la population totale : 1920 – 1954

[Les données sont des estimations officielles au 1er juillet ou des moyennes d'estimations officielles de fin d'année. Les chiffres en italiques sont les résultats de recensements et se rapportent à la date du dénombrement. Le type des estimations pour les années 1952 à 1954 est indiqué au tableau 1. Voir explications à la page 55.]

§ Estimation établies entre les deux derniers recensements et non encore alignées sur les résultats du dernier.

[1] Y compris 282 personnes se trouvant à Mafeking, la capitale, suitée en Union Sud-Africaine et environ 14 119 civils nationaux hors du pays. Non compris les nomades estimés à 20 000.

[2] Européens, indiens et métis qui représentent ensemble 1 pour cent environ de la population totale.

[3] Au 31 décembre.

[4] Non compris les prisonniers de guerre ennemis et les forces armées étrangères dans le pays.

[5] Non compris les ouvriers temporaires venus d'autres régions, (15 042 en 1951).

[6] Population de droit.

[7] Population "non marocaine" non compris les militaires dans les casernes.

[8] Estimation établie d'après le dénombrement en vue du rationnement de septembre 1950.

[9] Les fluctuations de 1943 à 1947 sont attribuées à un enregistrement incomplet, à la famine et à l'émigration.

[10] Territoire auparavant sous mandat (Union Sud-Africaine).

[11] Pendant la guerre: y compris les forces armées hors du pays; non compris les prisonniers de guerre ennemis s'élevant à 27 898 en 1946.

§ Estimates for last intercensal period not yet revised to accord with census results.
[3] For 31 December.
[6] *De jure* population.
[12] *De jure* population, but including US armed forces stationed in the area.
[13] Civilian population, excluding tourists.
[14] Prior to 1950, also excluding Newfoundland, which became the tenth province on 1 April 1949.
[15] Indigenous population, representing approximately 98 per cent of the total.
[16] Excluding Canal Zone shown separately above.
[17] *De jure* population, but excluding civilian citizens of continental US absent from the country for extended periods of time.
[18] Estimates for 1 September.
[19] Excluding Indian jungle population.
[20] Excluding Indian population of remote districts, estimated at 9 700 in 1921, 7 400 in 1931 and 6 000 in 1946.

§ Estimates for last intercensal period not yet revised to accord with census results.

[3] For 31 December.

[6] De *jure* population.

[21] Estimate each year includes 465 144 as adjustment for undernumeration at 1940 census, and 350 000 for Indian jungle population.

[22] Including Indian and Negro population of the interior, estimated at 11 200 in 1920, 19 600 in 1930, 20 500 in 1935, 21 600 for 1939–1945 and 25 700 for 1946–1952.

[23] Includes 182 000 for registered population and an estimate of 26 000 for "unregistered," i.e., Indian and Negro population of the interior.

[24] Excluding Indian jungle population, estimated at 100 600 in 1941 and 56 700 in 1950.

[25] Estimates for 1925 and 1930 exclude data for areas not enumerated in 1921; estimate for 1935 and 1940 exclude data for areas not enumerated in 1931.

[26] Excluding non-resident military and shipping personnel, numbering 36 606 in 1946.

[27] Excludes foreigners.

[28] Excluding persons in special military and internment camps, numbering 12 422 at 1946 census.

[29] Civilian population, including refugees and immigrants estimated at 750 000 in 1940 and 600 000 in 1941.

[30] Including Kashmir-Jammu, and prior to 1951, excluding Chandernagor.

[31] Revised to accord with the results of the 1951 census.

[32] Excludes population of Kashmir-Jammu and tribal areas of Assam, estimated at 4.41 million and 560 600 respectively.

[33] Prior to 1947, registration area of former British Provinces, representing approximately 75 per cent of former India, not including Burma. 1946: also excluding East Bengal. Beginning 1947, registration area of Republic of India.

[34] Prior to 1948, including Netherlands New Guinea.

[35] Prior to 1949, estimates for 21 March.

[36] Excluding Bedouin population in the Negev.

[37] Prior to 1948, Jewish population of Palestine.

[38] Prior to 1953, excluding the Amami Islands, transferred from the Ryukyu Islands 25 December 1953 (population 216 110 at 1 December 1950 census). Also excluding allied military and civilian personnel and their dependents. Prior to 1950, estimates for 1 October.

[39] For 1 November.

[40] Excludes military personnel and their families living on military installations.

[41] Korean nationals only. Estimates based on residents' register. Prior to 1941, series is not in accord with the results of quinquennial censuses 1920–1940.

[42] Excludes foreigners, numbering 21 885 at 1949 census.

[43] For 1 June.

[44] Lebanese nationals only.

[45] Excluding transients afloat, non-resident military personnel and enemy prisoners of war, numbering 14 735 at 1947 census.

[46] Prior to 1946, excluding Labuan (population 7 507 at 1 April 1931 census).

[47] Excluding Kashmir-Jammu, Gilgit, Baltistan, Junagadh and Manavadar.

[48] In registration area only, representing about 90 per cent of total.

[49] Territory formerly under British mandate. Excluding military personnel, numbering 2 507 at 1931 census.

§ Estimations établies entre les deux derniers recensements et non encore alignées sur les résultats du dernier.

[3] Au 31 décembre.

[6] Population de droit.

[21] L'estimation établie chaque année comprend une évaluation de 465 144 personnes pour compenser les lacunes du recensement de 1940 et une de 350 000 pour tenir compte des habitants de la jungle.

[22] Y compris la population indienne et nègre de l'intérieur estimée à 11 200 personnes en 1920, 19 600 en 1930, 20 500 en 1935, 21 600 pour la période de 1939 à 1945 et à 25 700 personnes pour celle de 1946 à 1952.

[23] Dont 182 000 pour la population enregistrée et une évaluation de 26 000 pour celle qui ne l'est pas et qui est constituée par les indiens et nègres de l'intérieur.

[24] Non compris la population indienne de la jungle estimée à 100 600 personnes en 1941 et à 56 700 en 1950.

[25] Les estimations pour 1925 et 1930 ne portent pas sur les territoires non recensés en 1921; les estimations pour 1935 et 1940 ne portent pas sur les territoires non recensés en 1931.

[26] Non compris les militaires non résidents et les équipages de la marine marchande s'élevant à 36 606 hommes en 1946.

[27] Non compris les étrangers.

[28] Non compris les personnes dans des camps militaires et d'internement s'élevant à 12 422 au recensement de 1946.

[29] Population civile, y compris les réfugiés et les immigrants s'élevant à 750 000 en 1940 et à 600 000 en 1941.

[30] Y compris le Cachemire-Jammu et, avant 1951, non compris Chandernagor.

[31] Chiffre aligné sur les résultats du recensement de 1951.

[32] Non compris le Cachemire-Jammu et la zone de tribus d'Assam avec une population estimée respectivement à 4 410 000 et 560 600 habitants.

[33] Avant 1947, territoire d'enregistrement des anciennes provinces britanniques, représentant approximativement 75 pour cent de l'Inde avant le partage, non compris la Birmanie. 1946: non compris également la partie orientale du Bengale. Depuis 1947, territoire d'enregistrement de la République de l'Inde.

[34] Avant 1948, y compris la Nouvelle-Guinée néerlandaise.

[35] Avant 1949, estimations au 21 mars.

[36] Non compris les bédouins du Negev.

[37] Avant 1948, population juive de Palestine.

[38] Avant 1953, non compris les îles Amami détachées des îles Ryû-Kyû le 25 décembre 1953 (216 110 habitants au recensement du 1er décembre 1950). Non compris également les militaires et civils alliés ainsi que les personnes à leur charge. Avant 1950, estimations au 1er octobre.

[39] Au 1er novembre.

[40] Non compris les militaires et leurs familles vivant dans des baraquements de l'armée.

[41] Coréens seulement. Estimations basées sur les registres de la population de résidence habituelle. Avant 1941, la série ne correspond pas tout à fait aux résultats des recensements quinquennaux de 1920 à 1940.

[42] Non compris les étrangers au nombre de 21 885 lors du recensement de 1949.

[43] Au 1er juin.

[44] Nationaux libanais seulement.

[45] Non compris les passagers à bord des navires, les militaires non résidents et les prisonniers de guerre ennemis s'élevant ensemble à 14 735 au recensement de 1947.

[46] Avant 1946, non compris le Labuan (7 507 habitants au recensement du 1er avril 1931).

[47] Non compris le Cachemire-Jammu, le Gilgit, le Bultistan, le Junagadh et le Manavadar.

[48] Sur le territoire d'enregistrement seulement, comprenant environ 90 pour cent de la population totale.

[49] Territoire auparavant sous mandat britannique. Non compris les troupes s'élevant à 2 507 hommes au recensement de 1931.

* Provisional.

§ Estimates for last intercensal period not yet revised to accord with census results.

[3] For 31 December.

[6] *De jure* population.

[39] For 1 November.

[50] Excluding the Amami Islands transferred to Japan on 25 December 1953 (population 216 110 at 1 December 1950 census). 1940–1944 and 1949–1950: excluding military and foreign population. 1952–1953: permanent residents of the Ryukyus only.

[51] For 1 October.

[52] Prior to 1947, Singapore Island only. Excluding transients afloat, non-resident military personnel and enemy prisoners of war, numbering 36 015 at 1947 census.

[53] Excluding nomad and semi-nomad population, estimated at 288 400 in 1945.

[54] Prior to 1939, excluding Hatay, acquired from Syria 29 June 1939, with population estimated at 204 000 at time of transfer.

[55] *De facto* population.

[56] Excludes the population of 41 communes not under Belgian administration (population 88 090 in 1939).

[57] Prior to 1941, excluding Southern Dobruja.

[58] 1940–1945: low estimates attributable to conditions during the war.

[59] Civilian population only.

[60] Prior to 1948, excluding territory ceded by Hungary in 1947 (population 3 379 in 1941).

[61] Prior to 1950, Finnish nationals in Finland, including merchant seamen at sea.

[62] Excluding enemy prisoners of war, estimated at 663 000 in 1946 and 486 000 in 1947. Beginning 1946, including each year allowances of 300 000 for armed forces and 6 000 for merchant seamen outside country at time of 1946 census.

[63] 1920–1945: territory defined by Treaty of Versailles; beginning 1946, present territory but excluding commune of Kirrberg prior to May 1949. *De jure* population, excluding troops in garrisons and drafted labourers during war years.

[64] For 1 April.

[65] Territory of 1937.

[66] *De jure* population, including displaced persons in camps.

[67] Beginning 1951, West Berlin only.

[68] Prior to 1948, excluding Dodecanese.

[69] Prior to 1944, including territory ceded to Czechoslovakia in 1947.

[70] 1940–1950: including armed forces outside country and civilians following the troops. Beginning 1951, *de jure* population.

[71] Including Free Territory of Trieste and territories ceded to Yugoslavia and France in 1947.

[72] Prior to 1949, excluding villages of Elten and Tüddern (population approximately 9 000 in 1949).

2. Estimations de la population totale (suite)

* Provisoire.

§ Estimations établies entre les deux derniers recensements et non encore alignées sur les résultats du dernier.

[3] Au 31 décembre.

[6] Population de droit.

[39] Au 1er novembre.

[50] Non compris les îles Amami rendues au Japon le 25 décembre 1953 (216 110 habitants au recensement du 1er décembre 1950). 1940–1944 et 1949–1950: non compris les militaires et les étrangers. 1952–1953: résidents permanents des îles Ryû-Kyû seulement.

[51] Au 1er octobre.

[52] Avant 1947, île de Singapour seulement. Non compris les passagers à bord des navires, les militaires non residents et les prisonniers de guerre ennemis s'élevant ensemble à 36 015 au recensement de 1947

[53] Non compris les nomades et semi-nomades estimés à 288 400 en 1945.

[54] Avant 1939, non compris Hatay, cédé par la Syrie le 29 juin 1939 avec une population estimée à 204 000 habitants au moment du transfert.

[55] Population de droit.

[56] Non compris les 41 communes qui n'étaient pas alors administrées par la Belgique (88 090 habitants en 1939).

[57] Avant 1941, non compris la Dobroudja méridionale.

[58] 1940–1945: estimations peu élevées attribuables aux conditions spéciales de la période de guerre.

[59] Population civile seulement.

[60] Avant 1948, non compris le territoire cédé par la Hongrie en 1947 (3 379 habitants en 1941).

[61] Avant 1950, nationaux finlandais en Finlande, y compris les équipages de la marine marchande en mer.

[62] Non compris les prisonniers de guerre ennemis estimés à 663 000 en 1946 et à 486 000 en 1947. Depuis 1946, l'estimation établie chaque année comprend une évaluation de 300 000 hommes pour les forces armées stationnées hors du territoire métropolitain et une de 6 000 pour les équipages de la marine marchande en mer, lors du recensement de 1946.

[63] 1940–1945: territoire du traité de Versailles; depuis 1946, territoire actuel, non compris la commune de Kirrberg avant mai 1949. Population de droit, non compris les troupes en garnison et les personnes versées dans le service du travail pendant les années de guerre.

[64] Au 1er avril.

[65] Territoire de 1937.

[66] Population de droit, y compris les personnes déplacées dans les camps.

[67] Depuis 1951, Berlin-Ouest seulement.

[68] Avant 1948, non compris le Dodécanèse.

[69] Avant 1944, y compris le territoire cédé à la Tchécoslovaquié en 1947.

[70] 1940–1950: y compris les forces armées hors du pays ainsi que les civils accompagnant les troupes. Depuis 1951, population de droit.

[71] Y compris le territoire libre de Trieste et les régions cédées à la Yougoslavie et à la France en 1947.

[72] Avant 1949, non compris les villages d'Elten et de Tüddern (environ 9 000 habitants en 1949).

* Provisional.

§ Estimates for last intercensal period not yet revised to accord with census results.

[3] For 31 December.

[4] Excluding enemy prisoners of war and alien armed forces within the country.

[6] *De jure* population.

[12] *De jure* population, but including US armed forces stationed in the area.

[31] Revised to accord with the results of the 1951 census.

[64] For 1 April.

[73] Prior to 1946, territory of 1923–1937, i.e., including areas ceded to USSR after World War II and excluding Danzig and areas formerly part of Germany.

[74] Prior to 1940, including Southern Dobruja (ceded to Bulgaria in 1940) and Bessarabia and Northern Bucovina (ceded to USSR in 1940). 1940–1945: excluding Northern Transylvania (temporarily ceded to Hungary), but in 1943, including Bessarabia and Northern Bucovina (temporarily regained from USSR).

[75] Beginning 1943, British–US Zone only.

[76] Excluding enemy prisoners of war. 1940–1949: including UK armed forces overseas and merchant seamen at sea, but excluding Commonwealth and foreign armed forces within the country. 1950: including merchant seamen at sea.

[77] 1943–1947: excluding certain classes of seamen, estimated at 151 000 in 1943.

[78] Prior to 1947, excluding territory ceded by Italy in 1947.

[79] Excluding full-blooded aborigines, estimated at 47 000 in 1944. 1940–1946: including armed forces outside country.

[80] Estimates for 31 March.

[81] Excluding US administrative and military personnel.

[82] Prior to 1950 and for 1954, estimates for 31 March.

2. Estimations de la population totale (suite)

* Provisoire.

§ Estimations établies entre les deux derniers recensements et non encore alignées sur les résultats du dernier.

[3] Au 31 décembre.

[4] Non compris les prisonniers de guerre ennemis et les forces armées étrangères dans le pays.

[6] Population de droit.

[12] Population de droit, y compris les forces armées américaines stationnées dans la région.

[31] Chiffre aligné sur les résultats du recensement de 1951.

[64] Au 1er avril.

[73] Avant 1946, territoire de 1923–1937, c'est-à-dire, y compris les régions cédées à l'URSS après la Seconde Guerre mondiale et non compris Dantzig ainsi que les provinces faisant autrefois partie de l'Allemagne.

[74] Avant 1940, y compris la Dobroudja méridionale (cédée à la Bulgarie en 1940), la Bessarabie et la Bukovine du Nord (cédées à l'URSS en 1940); 1940–1945: non compris la Transylvanie du Nord (cédée temporairement à la Hongrie) mais y compris, en 1943, la Bessarabie et la Bukovine du Nord (temporairement reconquises sur l'URSS).

[75] Depuis 1943, zone anglo-américaine seulement.

[76] Non compris les prisonniers de guerre ennemis. 1940–1949: y compris les forces armées britanniques outre-mer, et les équipages de la marine marchande en mer et non compris les troupes étrangères et celles du Commonwealth dans le pays. 1950: y compris les équipages de la marine marchande en mer.

[77] 1943–1947: non compris certaines classes de marins au nombre approximatif de 151 000 en 1943.

[78] Avant 1947, non compris le territoire cédé par l'Italie en 1947.

[79] Non compris les purs aborigènes estimés à 47 000 en 1944. 1940–1946: Y compris les forces armées nationales hors du pays.

[80] Estimations au 31 mars.

[81] Non compris les militaires et fonctionnaires américains.

[82] Avant 1950 et pour 1954, estimations au 31 mars.

3. Population by age and sex : latest census, 1946–1953, and latest available estimate, 1950–1954

[Data not previously published in the *Yearbook*. For evaluation of quality of estimates 1952–1954, see Table 1 and discussion, page 15.]

[1] Including 282 persons in Mafeking, the capital, which is located in the Union of South Africa, and 14 119 civilian nationals outside the territory.
[2] "Non-Moroccan" population, excluding military personnel in barracks. Population believed to be underenumerated.
[3] Including British Cameroons.
[4] Under 2 years.
[5] 2–6 years.
[6] 7–14 years.
[7] Comprises the white population of the territory and the indigenous population of Fernando Póo.
[8] *De jure* population, but including US armed forces stationed in the area.
[9] *De jure* population, i.e., excluding tourists and all members of the British naval and military establishments in Bermuda.

3. Population selon l'âge et le sexe : dernier recensement, 1946–1953, et estimation disponible, 1950–1954

[Données non encore publiées dans l'*Annuaire*. Voir tableau 1 et page 56 pour des précisions sur la qualité des estimations de population.]

[1] Y compris 282 personnes se trouvant à Mafeking, la capitale, située en Union Sud-Africaine et environ 14 119 civils nationaux hors du pays.
[2] Population "non marocaine", non compris les militaires dans les casernes. Chiffre de la population considéré comme inférieur à la réalité par suite de lacunes dans le recensement.
[3] Y compris le Cameroun britannique.
[4] Moins de 2 ans.
[5] 2 à 6 ans.
[6] 7 à 14 ans.
[7] Comprend la population blanche du territoire et la population indigène de Fernando Po.
[8] Population de droit, mais y compris les forces armées américaines stationnées dans la région.
[9] Population de droit, c'est-à-dire, non compris les touristes et les effectifs de la marine et de l'armée britannique aux Bermudes.

3. Population by age and sex (continued)

[See headnote on page 122.]

[10] De *jure* population.
[15] Excluding aborigines.
[16] Excluding adjustment (67 067) for underenumeration and 12 881 schedules not tabulated by age.
[17] Excluding Indian jungle population, estimated at 56 700 in 1950.
[18] Excluding foreigners.
[19] Reason for discrepancy between this and corresponding figure in Table 1 not ascertained.
[20] Data are a smoothed age distribution based on a 10 per cent sample, and exclude Kashmir-Jammu, tribal areas of Assam, Andaman and Nicobar Islands and Chandernagor.
[21] Excluding nomad population, estimated at 250 000 at time of census.
[22] Japanese nationals in Japan only. Because of rounding, totals are not in all cases the sum of the parts.

3. Population selon l'âge et le sexe (suite)

[10] Population de droit.
[15] Non compris les aborigènes.
[16] Non compris un ajustement (67 067) pour compenser les lacunes du recensement et 12 881 questionnaires qui n'ont pas fait l'objet d'une répartition par âge.
[17] Non compris la population indienne de la jungle estimée à 56 700 personnes en 1950.
[18] Non compris les étrangers.
[19] L'origine de la disparité entre cette donnée et le chiffre correspondant du tableau 1 n'a pu être déterminée.
[20] Les données se rapportent à une répartition par âge "rectifiée" obtenue par sondage (10 pour cent) et ne comprennent pas le Cachemire-Jammu, la zone de tribus d'Assam, les îles Andaman et Nicobar ainsi que Chandernagor.
[21] Non compris les nomades estimés à 250 000 au moment du recensement.
[22] Nationaux japonais au Japon seulement. Comme les chiffres ont été arrondis, les totaux ne correspondent pas toujours à la somme des éléments.

[10] Population de droit.

[25] Population de droit. Comme les chiffres ont été arrondis, les totaux ne correspondent pas toujours à la somme des éléments.

[26] Population de droit à l'exclusion des familles des militaires et de certains autres résidents.

[27] Total provisoire des résultats du recensement de la population dont la composition par âge et par sexe a été calquée sur la répartition selon l'âge et le sexe de l'estimation de la population au 31 décembre 1950.

3. Population by age and sex (continued)

[See headnote on page 122.]

[4] Including consensually married.
[9] *De jure* population, but including US armed forces stationed in the area.
[10] Reason for discrepancies between these and corresponding data shown in Table 3 not ascertained.
[29] *De jure* population, but excluding armed forces outside continental United States and civilian citizens absent from country for extended periods.
[30] Data based on a 20 per cent sample of census returns.

[4] Including consensually married.
[11] *De jure* population.
[39] Excluding British defence forces, numbering 9 278.
[40] Including consensually married; excluding legally separated.
[41] Excluding Burma, tribal areas in Baluchistan and the Northwest Frontier Province and part of Ahmedabad City.
[42] Excluding 111 536 persons whose census schedules were destroyed. Also excluding Kashmir-Jammu and part of tribal areas of Assam.
[43] Including Ryukyu Islands.
[44] Data based on a 10 per cent sample of census returns. Because of rounding, totals are not in all cases the sum of the parts.

[3] Data relate to women who have borne children.
[10] Data relate to women ever married, excluding those who have not borne children or have borne an unknown number of children.
[11] Excluding Indian population of remote districts, estimated at 6 000.
[12] Enumerated population, excluding adjustment for underenumeration (465 144) and Indian jungle population, estimated at 350 000.
[13] The distribution of women by number of children is based on a sample of population and the totals are not in all cases the sum of the parts.

[3] Les données se rapportent aux femmes qui ont eu des enfants.

[10] Les données se rapportent aux femmes mariées et à celles qui l'ont été, à l'exclusion des personnes qui n'ont pas eu d'enfants ou qui en ont eu un nombre inconnu.

[11] Non compris la population indienne des districts éloignés, estimée à 6 000 personnes.

[12] Population dénombrée, non compris une évaluation de 465 144 personnes pour compenser les lacunes du recensement et une de 350 000 pour tenir compte des indiens vivant dans la jungle.

[13] La répartition des femmes suivant le nombre d'enfants a été effectuée par sondage et les totaux ne correspondent pas toujours à la somme des éléments.

[16] Excluding aborigines not classified by age, numbering 158 428 in 1918 and 4 775 in 1938.
[17] Excluding adjustment for underenumeration (67 067) and 12 881 schedules not tabulated by age.
[18] Enumerated population, excluding adjustment for underenumeration (465 144) and Indian jungle population estimated at 350 000.
[19] Excluding tribal Indian population, estimated at 103 000 in 1936, 100 600 in 1941, and 56 700 in 1950.
[20] Excluding Perim.
[21] Excluding persons in special internment camps.
[22] Territory at date of census; for 1931, excluding Burma.
[23] Data are a smoothed age-distribution based on a 10 per cent sample. Excluding Kashmir-Jammu, tribal areas of Assam, Andaman and Nicobar Islands and Chandernagor.
[24] Jewish population of Palestine.
[25] Japan proper, excluding Formosa and Southern Sakhalin (Karafuto) which were made parts of Japan proper in December 1942 and April 1943 respectively.
[26] Korean nationals only.
[27] Excluding nomad population.
[28] Settled Moslem population of territory formerly under British mandate. For data pertaining to Jewish population, see Israel above.
[29] Excluding Hatay.

[16] Non compris les aborigènes non répartis suivant l'âge, s'élevant à 158 428 en 1918 et à 4 775 en 1938.
[17] Non compris un ajustement pour compenser les lacunes du recensement (sous-estimation évaluée à 67 067 personnes) et 12 881 questionnaires qui n'ont pas fait l'objet d'une répartition par âge.
[18] Population dénombrée, non compris une évaluation de 465 144 personnes pour compenser les lacunes du recensement et une de 350 000 pour tenir compte des indiens vivant dans la jungle.
[19] Non compris les indiens groupés en tribus estimés à 103 000 en 1936, 100 600 en 1941 et 56 700 en 1950.
[20] Non compris Perim.
[21] Non compris les personnes internées dans des camps.
[22] Territoire à la date du recensement; pour 1931, non compris la Birmanie.
[23] Les données se rapportent à une répartition par âge "rectifiée" obtenue par sondage (10 pour cent). Non compris le Cachemire-Jammu, la zone de tribus d'Assam, les îles Andaman et Nicobar ainsi que Chandernagor.
[24] Population juive de Palestine.
[25] Japon proprement dit, non compris Formose et la partie méridionale des îles Sakhaline (Karafuto) qui furent respectivement intégrées au Japon proprement dit en décembre 1942 et avril 1943.
[26] Nationaux coréens seulement.
[27] Non compris les nomades.
[28] Population musulmane du territoire auparavant sous mandat britannique, à l'exclusion des nomades. Voir Israël ci-dessus, pour les données relatives à la population juive.
[29] Non compris Hatay.

[15] Territory at date of census.
[30] Excluding the cantons of Eupen, Malmedy and St. Vith, not under Belgian administration.
[31] 1900 and 1910: including Southern Dobruja but excluding territory acquired in Balkan wars and retained after World War I. 1920–1934: excluding Southern Dobruja.
[32] 1921 and 1930: including Subcarpathia and a part of Slovakia ceded to USSR in 1947. 1947: excluding territory ceded by Hungary in 1947.
[33] Excluding South Jutland.
[34] Prior to 1950, Finnish nationals only, including those outside country.
[35] 1927–1939: territory of the Treaty of Versailles. 1946: excluding commune of Kirrberg.
[36] Territory of 1937 excluding the Saar.
[37] Territory of the Treaty of Trianon.
[38] 1911: excluding territory acquired from Austria and Hungary after World War I. 1921–1936: territory of 1924–1938.

[15] Territoire à la date du recensement.
[30] Non compris les cantons d'Eupen, de Malmedy et de Saint-Vith qui n'étaient pas administrés par la Belgique.
[31] 1900 et 1910: y compris la Dobroudja mériodionale mais non compris le territoire acquis à la suite des guerres balkaniques et conservé après la Première Guerre mondiale. 1920–1934: non compris la Dobroudja méridionale.
[32] 1921 et 1930: y compris la région subcarpatique et une partie de la Slovaquie cédées à l'URSS en 1947. 1947: non compris le territoire cédé par la Hongrie en 1947.
[33] Non compris le Jutland méridional.
[34] Avant 1950, nationaux finlandais seulement, y compris ceux hors du pays.
[35] 1927–1939: territoire du traité de Versailles. 1946: non compris la commune de Kirrberg.
[36] Territoire de 1937 à l'exclusion de la Sarre.
[37] Territoire du traité de Trianon.
[38] 1911: non compris le territoire obtenu de l'Autriche-Hongrie après la Première Guerre mondiale. 1921–1936: territoire de 1924–1938.

[15] Territory at date of census.
[39] Including territory ceded to USSR after World War II; excluding Danzig and areas formerly part of Germany.
[40] Excluding Banat and Transylvania.
[41] British-US Zone only.
[42] Excluding territory ceded by Italy in 1947.
[43] Excluding full-blooded aborigines, estimated at 47 000 in 1944.
[44] Indigenous population only.
[45] Samoan population only.

[15] Territoire à la date du recensement.
[39] Y compris le territoire cédé à l'URSS après la Deuxième Guerre mondiale; non compris Dantzig et les régions faisant autrefois partie de l'Allemagne.
[40] Non compris le Banat de Temesvar et la Transylvanie.
[41] Zone anglo-américaine seulement.
[42] Non compris le territoire cédé par l'Italie en 1947.
[43] Non compris les purs aborigènes estimés à 47 000 en 1944.
[44] Population indigène seulement.
[45] Samoans seulement.

8. Number of live births : 1938 – 1953

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

[2] Data exclude live-born infants dying before registration of birth.

[3] Statistics based on baptisms recorded in church registers.

[4] European, Indian and Coloured, together comprising about one per cent of the total population.

[5] See Table 9 for estimated birth rate among total population.

[6] Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.

[7] Bathurst (Colony) only.

[8] Compulsory registration areas, which include about one-tenth of the total population.

[9] "Non-Moroccan" population.

[10] Lagos only.

[11] See Table 9 for estimated birth rate among indigenous population.

[12] Registration system for African population introduced in 1947.

[13] Freetown and the rest of the Colony only.

[14] Former mandated territory (Union of South Africa).

[15] Data exclude live-born infants dying within 24 hours of birth.

8. Nombre de naissances vivantes : 1938 – 1953

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

1 La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrement irréguliers.

2 Les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

3 Statistiques établies d'après les baptêmes inscrits sur les registres de l'église.

4 Européens, indiens et métis représentant ensemble 1 pour cent environ de la population totale.

5 Voir l'estimation du taux de natalité pour l'ensemble de la population au tableau 9.

6 L'enregistrement des naissances est facultatif; il n'est considéré comme complet que pour la population non indigène représentant une proportion relativement faible de la population totale.

7 Bathurst (Colonie) seulement.

8 Naissances signalées dans les régions où l'enregistrement est obligatoire et qui comprennent un dixième environ de la population totale.

9 Population "non marocaine."

10 Lagos seulement.

11 Voir l'estimation du taux de natalité pour la population indigène au tableau 9.

12 Un système d'enregistrement pour la population africaine est entré en vigueur en 1947.

13 Freetown et le reste de la Colonie seulement.

14 Territoire auparavant sous mandat (Union Sud-Africaine).

15 Les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

8. Number of live births (continued)

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

1 Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

2 Data exclude live-born infants dying before registration of birth.

15 Data exclude live-born infants dying within 24 hours of birth.

16 Registration among Moslem population very incomplete.

17 According to test of birth registration, 92.1 per cent complete in 1950.

18 Excluding Yukon and Northwest Territories and, prior to 1950, Newfoundland, which became the tenth province on 1 April 1949. Data include births to Canadian residents temporarily in the United States; exclude births to US residents temporarily in Canada.

19 According to test of birth registration, 98 per cent complete in 1941.

20 Coverage improved in recent years.

21 Data include stillbirths.

22 Registered births probably account for only 50 per cent of occurrences.

23 Data include upward adjustments for underregistration as follows: 1930-1939, 3 per cent; 1940-1949, 2 per cent; 1950, 1.5 per cent.

24 For Curaçao, Aruba and Bonaire only.

25 Excluding tribal Indian population, and also data for Canal Zone shown separately above.

26 Coverage notably incomplete in earlier years.

27 According to test of birth registration, 86.5 per cent complete in 1940.

28 Beginning 1951, final tabulations are based on a 50 per cent sample.

8. Nombre de naissances vivantes (suite)

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

1 La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrement irréguliers.

2 Les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

15 Les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

16 Enregistrement très incomplet pour la population musulmane.

17 Une évaluation du système a permis de conclure que l'enregistrement des naissances était complet dans une proportion de 92,1 pour cent en 1950.

18 Non compris le Yukon, les Territoires du Nord-Ouest et, avant 1950, Terre-Neuve qui constitute la 10ème province du dominion depuis le 1er avril 1949. Les données comprennent les naissances d'enfants de Canadiens résidant provisoirement aux Etats-Unis; elles ne comprennent pas les naissances d'enfants de résidents américains temporairement au Canada.

19 Une évaluation du système a permis de conclure que l'enregistrement des naissances était complet dans une proportion de 98 pour cent en 1941.

20 Portée des données améliorée les dernières années.

21 Les données comprennent les mort-nés.

22 Les naissances enregistrées ne représentent probablement que 50 pour cent du total.

23 Les données ont été ajustées dans la proportion suivante pour compenser les lacunes de l'enregistrement: 1930-1939, 3 pour cent; 1940-1949, 2 pour cent; 1950, 1,5 pour cent.

24 Pour Curaçao, Aruba et Bonaire seulement.

25 Non compris les indiens groupés en tribus et, également, la Zone du Canal qui figure séparément ci-dessus.

26 Données très incomplètes pour les premières années.

27 Une évaluation du système a permis de conclure que l'enregistrement des naissances était complet dans une proportion de 86,5 pour cent en 1940.

28 Depuis 1951, les chiffres définitifs reposent sur un sondage à 50 pour cent.

8. Number of live births (continued)

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

1 Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

2 Data exclude live-born infants dying before registration of birth.

3 Statistics based on baptisms recorded in church registers.

15 Data exclude live-born infants dying within 24 hours of birth.

21 Data include stillbirths.

26 Coverage notably incomplete in earlier years.

28 Beginning 1951, final tabulations are based on a 50 per cent sample.

29 According to test of birth registration, 92.5 per cent complete in 1940 and 97.9 per cent in 1950.

30 Registration estimated to be 97 per cent complete.

31 Prior to 1948, data exclude live-born infants dying within 24 hours of birth.

32 Compulsory civil registration initiated in 1940.

33 Beginning 1948, excluding aborigines, who comprise about one-tenth of the total population and for whom data are unreliable.

34 Data include births registered within two years of occurrence.

35 Excluding Galápagos Islands and provinces of Napo Pastaza and Santiago Zamora.

36 Excluding Indian jungle population, estimated at 350 000.

37 Excluding Negro and Indian population of the interior, estimated at 11 000 in 1921 and 25 700 in 1947.

38 Excluding Indian jungle population, estimated at 56 700 in 1950.

39 Colony only.

40 Prior to 1940, registration area only, representing 82.5 per cent of the total population at 1931 census. Beginning 1947, certain towns only, numbering 60 in 1951 and 1953, and 62 in 1952, and having a population of approximately 1.3 million.

41 Excluding tribal aborigines. Beginning 1949, also excluding foreigners.

42 Including Chandernagor, which became part of the Republic of India 2 May 1950.

43 Prior to 1947, registration area of former British Provinces, representing approximately 75 per cent of former India, not including Burma. 1946: also excluding East Bengal. Beginning 1947, registration area of Republic of India.

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

1 La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrement irréguliers.

2 Les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

3 Statistiques établies d'après les baptêmes inscrits sur les registres de l'église.

15 Les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

21 Les données comprennent les mort-nés.

26 Données très incomplètes pour les premières années.

28 Depuis 1951, les chiffres définitifs reposent sur un sondage à 50 pour cent.

29 Une évaluation du système a permis de conclure que l'enregistrement des naissances était complet dans une proportion de 92,5 pour cent en 1940 et de 97,9 pour cent en 1950.

30 Enregistrement des naissances considéré comme complet dans une proportion de 97 pour cent.

31 Avant 1948, les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

32 L'enregistrement obligatoire est entré en vigueur en 1940.

33 Depuis 1948, non compris les aborigènes qui représentent un dixième environ de la population totale et pour lesquels les données sont sujettes à caution.

34 Les données comprennent les naissances enregistrées dans un délai de deux ans.

35 Non compris les Iles Galapagos et les provinces de Napo Pastaza et de Santiago Zamora.

36 Non compris la population indienne de la jungle estimée à 350 000 personnes.

37 Non compris la population nègre et indienne de l'intérieur estimée à 11 000 personnes en 1921 et à 25 700 en 1947.

38 Non compris la population indienne de la jungle estimée à 56 700 personnes en 1950.

39 Colonie seulement.

40 Avant 1940, territoire d'enregistrement seulement, comprenant 82,5 pour cent de la population totale au recensement de 1931. Depuis 1947, quelques villes seulement s'élevant à 60 en 1951 et 1953, à 62 en 1952, avec une population de 1 300 000 habitants environ.

41 Non compris les tribus aborigènes. Depuis 1949, non compris également les étrangers.

42 Y compris Chandernagor qui fait partie de la République de l'Inde depuis le 2 mai 1950.

43 Avant 1947, territoire d'enregistrement des anciennes provinces britanniques, représentant approximativement 75 pour cent de l'Inde avant le partage, non compris la Birmanie. 1946: non compris également la partie orientale du Bengale. Depuis 1947, territoire d'enregistrement de la République de l'Inde.

8. Number of live births (continued)

[For discussion, see page 21.]

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

1 Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverages are coded "U".

2 Data exclude live-born infants dying before registration of birth.

6 Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.

21 Data include stillbirths.

44 Prior to 1948, including Netherlands New Guinea.

45 In Java and Madura only.

46 Prior to 1949, years ended 21 March.

47 Excluding Bedouin population in the Negev.

48 Prior to 1948, Jewish population of Palestine.

49 Japanese nationals in Japan only.

50 For East Jordan only.

51 Lebanese nationals only.

52 Prior to 1941, territory of former British Malaya, i.e., including Singapore.

53 Registration area only, representing about 90 per cent of the total population.

54 Settled Moslem population of territory formerly under British mandate. For births among Jewish population, see Israel above.

55 Present territory, i.e., excluding Amami Islands, which reverted to Japan 25 December 1953.

56 Includes births in Amami Islands.

57 Registration has improved under Registration Ordinance, operative since 1949, and is now believed to be 80 per cent complete.

58 Prior to 1947, Singapore Island only.

59 Excluding nomad and semi-nomad population, estimated at 288 400 in 1945.

60 Excludes births in the 41 communes not under Belgian administration.

61 Prior to 1941, excluding Southern Dobruja.

62 Fluctuations 1940-1945 are attributable to conditions during the war.

63 Excludes births in Alderney and Sark.

64 Prior to 1948, excluding territory ceded by Hungary in 1947.

65 Excludes births among civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at the end of 1948.

66 Prior to 1951, Finnish nationals in Finland only.

67 1939-1942 and 1945: excluding Departments of Bas-Rhin, Haut-Rhin and Moselle; in 1943 and 1944, excluding Corsica also.

68 Prior to 1947, territory of the Treaty of Versailles; January 1947—April 1949, present territory, excluding the commune of Kirrberg.

69 Territory of 1937.

70 Beginning 1951, West Berlin only.

71 Prior to 1948, excluding Dodecanese. Beginning 1949, data are estimates based on births reported in a varying number of the 5 968 communes, i.e., 3 215 in 1949, 3 581 in 1950, 4 865 in 1951, 5 245 in 1952, and 4 998 in 1953.

8. Nombre de naissances vivantes (suite)

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

1 La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrement irréguliers.

2 Les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

6 L'enregistrement des naissances est facultatif; il n'est considéré comme complet que pour la population non indigène représentant une proportion relativement faible de la population totale.

21 Les données comprennent les mort-nés.

44 Avant 1948, y compris la Nouvelle-Guinée néerlandaise.

45 A Java et Madoura seulement.

46 Avant 1949, années terminées le 21 mars.

47 Non compris les bédouins du Negev.

48 Avant 1948, population juive de la Palestine.

49 Les données concernent seulement les nationaux japonais au Japon.

50 Pour la Jordanie orientale seulement.

51 Les données concernent seulement les nationaux libanais.

52 Avant 1941, territoire de l'ancienne Malaisie britannique, c'est-à-dire, y compris Singapour.

53 Territoire d'enregistrement seulement, comprenant environ 90 pour cent de la population totale.

54 Population musulmane du territoire auparavant sous mandat britannique, à l'exclusion des nomades. Pour les naissances parmi la population juive, voir Israël, ci-dessus.

55 Territoire actuel, c'est-à-dire, non compris les Iles Amami rendues au Japon le 25 décembre 1953.

56 Y compris les Iles Amami.

57 L'enregistrement s'est amélioré depuis l'entrée en vigueur de l'Ordonnance d'Enregistrement en 1949 et est à présent considéré comme complet dans une proportion de 80 pour cent.

58 Avant 1947, l'île de Singapour exclusivement.

59 Non compris les nomades et semi-nomades estimés à 288 400 en 1945.

60 Non compris les naissances dans les 41 communes qui n'étaient pas administrées par la Belgique.

61 Avant 1941, non compris la Dobroudja méridionale.

62 Les fluctuations entre 1940 et 1945 proviennent des conditions spéciales de la période de guerre.

63 Non compris Alderney et Sercq.

64 Avant 1948, non compris le territoire cédé par la Hongrie en 1947.

65 Non compris les naissances parmi les civils étrangers vivant au Danemark sans permis de séjour, environ 200 000 en 1945 et 2 500 fin 1948.

66 Avant 1951, nationaux finlandais en Finlande seulement.

67 1939-1942 et 1945, non compris le Bas-Rhin, le Haut-Rhin et la Moselle. 1943 et 1944, non compris le Bas-Rhin, le Haut-Rhin, la Moselle et la Corse.

68 Avant 1947, territoire du traité de Versailles; janvier 1947—avril 1949, territoire actuel non compris la commune de Kirrberg.

69 Territoire de 1937.

70 Depuis 1951, Berlin-Ouest seulement.

71 Avant 1948, non compris le Dodécanèse. Depuis 1949, les données sont des estimations reposant sur les naissances signalées dans un certain nombre des 5 968 communes: 3 215 en 1949, 3 581 en 1950, 4 865 en 1951, 5 245 en 1952 et 4 998 en 1953.

8. Number of live births (continued)

For discussion, see page 21.]

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

[28] Beginning 1951, final tabulations are based on a 50 per cent sample.

[72] Prior to 1948, including territory ceded to Czechoslovakia in 1947.

[73] Data include births registered within one year of occurrence.

[74] Prior to 1943, territory of 1924-1938.

[75] Prior to 1949, excluding villages of Elten and Tüddern. Data include births occurring outside country if one or both parents are listed in a Netherlands population register.

[76] Data include births to Norwegian residents temporarily in Sweden.

[77] Prior to 1947, territory of 1923-1937.

[78] Data less reliable before 1950.

[79] Changing territory; for description, see Table 2.

[80] Beginning 1943, British-US Zone only.

[81] Prior to 1947, excluding territory ceded by Italy in 1947.

[82] Coverage for 1947 and 1948 is incomplete owing to post-war reorganization of Registrar's Service.

[83] Excluding full-blooded aborigines, estimated at 47 000 in 1940.

[84] Years ended 31 March.

[85] Prior to 1949, data include stillbirths.

[86] Years ended 30 June.

[87] Data include stillbirths among Samoan population. Prior to 1951, years ended 31 March.

[88] Among Samoan population only.

8. Nombre de naissances vivantes (suite)

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrement irréguliers.

[28] Depuis 1951, les chiffres définitifs reposent sur un sondage à 50 pour cent.

[72] Avant 1948, y compris le territoire cédé à la Tchécoslovaquie en 1947.

[73] Les données comprennent les naissances enregistrées dans un délai d'un an.

[74] Avant 1943, territoire de 1924-1938.

[75] Avant 1949, non compris les villages d'Elten et Tüddern. Les données comprennent les naissances survenues à l'étranger si l'un des parents au moins est porté sur un registre d'état civil néerlandais.

[76] Les données comprennent les naissances parmi les Norvégiens temporairement en Suède.

[77] Avant 1947, territoire de 1923-1937.

[78] Données moins complètes avant 1950.

[79] Territoire de l'époque, voir précisions au tableau 2.

[80] Depuis 1943, zone anglo-américaine seulement.

[81] Avant 1947, non compris le territoire cédé par l'Italie en 1947.

[82] Données incomplètes pour 1947 et 1948 à la suite de la réorganisation, après guerre, des services de l'état civil.

[83] Non compris les purs aborigènes estimés à 47 000 en 1940.

[84] Années terminées le 31 mars.

[85] Avant 1949, y compris les mort-nés.

[86] Années terminées le 30 juin.

[87] Les données comprennent les mort-nés parmi les Samoans. Avant 1951, années terminées le 31 mars.

[88] Naissances parmi les Samoans exclusivement.

9. Crude birth rates : 1920 — 1953

[Rates are the number of live births per 1 000 population. For discussion, see page 22.]

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

1 Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

2 Rates exclude live-born infants dying before registration of birth.

3 Rates based on baptisms recorded in church registers.

4 European, Indian and Coloured, together comprising about one per cent of the total population.

5 Estimated rate for total population is 31.5 according to recent surveys.

6 For 1922-24.

7 Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.

8 Bathurst (Colony) only.

9 Compulsory registration areas, which include about one-tenth of the total population.

10 Reliability of rates affected by movements of population to and from the areas where registration is compulsory.

11 For 1931-34.

12 "Non-Moroccan" population. Rates computed on population excluding personnel in military establishments.

13 Estimated rate for the indigenous population was 59.0 according to sample census of 1950.

14 Registration system for African population introduced in 1947.

15 Estimated rate for the indigenous population was 42.9 in 1949.

16 For 1936-39.

17 Estimated rate for the indigenous population was 46.2 according to sample census of 1948.

18 Former mandated territory (Union of South Africa).

19 Rates exclude live-born infants dying within 24 hours of birth.

20 Registration among Moslem population very incomplete.

9. Taux bruts de natalité : 1920 — 1953

[Les taux représentent le nombre de naissances vivantes pour 1 000 habitants. Voir explications page 64.]

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

1 La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

2 Les taux ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

3 Taux reposant sur les baptêmes inscrits sur les registres de l'église.

4 Européens, indiens et métis représentant ensemble 1 pour cent environ de la population totale.

5 Des enquêtes récentes ont permis d'estimer à 31,5 pour 1 000 le taux se rapportant à la population totale.

6 Pour 1922-24.

7 L'enregistrement des naissances est facultatif; il n'est considéré comme complet que pour la population non-indigène représentant une proportion relativement faible de la population totale.

8 Bathurst (Colonie) seulement.

9 Taux reposant sur les naissances signalées dans les régions où l'enregistrement est obligatoire et qui comprennent un dixième environ de la population totale.

10 La qualité des taux est altérée par des mouvements de population en provenance et en direction des territoires où l'enregistrement est obligatoire.

11 Pour 1931-34.

12 Population "non-marocaine". La population à partir de laquelle les taux ont été calculés ne comprend pas les militaires dans les casernes.

13 Le recensement par sondage de 1950 a permis d'estimer à 59 pour 1 000 le taux se rapportant à la population indigène.

14 Un système d'enregistrement pour la population africaine est entré en vigueur en 1947.

15 Le taux se rapportant à la population indigène a été estimé à 42,9 pour 1 000 en 1949.

16 Pour 1936-39.

17 Le recensement par sondage de 1948 a permis d'estimer à 46,2 pour 1 000 le taux se rapportant à la population indigène.

18 Territoire auparavant sous mandat (Union Sud-Africaine).

19 Les taux ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

20 Enregistrement très incomplet pour la population musulmane.

9. Crude birth rates (continued)

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

1 Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

6 For 1922-24.

11 For 1931-34.

16 For 1936-39.

19 Rates exclude live-born infants dying within 24 hours of birth.

21 According to test of birth registration, 92.1 per cent complete in 1950.

22 Rates computed on civilian population.

23 For 1921-24.

24 Excluding Yukon and Northwest Territories and, prior to 1950, Newfoundland, which became the tenth province on 1 April 1949. Rates include births to Canadian residents temporarily in the United States; exclude births to US residents temporarily in Canada.

25 According to test of birth registration, 98 per cent complete in 1941.

26 1940-1946: rates computed on civilian population.

27 Coverage improved in recent years.

28 Rates include stillbirths.

29 Prior to 1939, rates exclude live-born infants dying before registration of birth.

30 Rates based on births which have been adjusted for underregistration as follows: 1930-1939, 3 per cent; 1940-1949, 2 per cent; 1950, 1.5 per cent.

31 For 1926-29.

32 For 1926-27.

33 For 1930-32.

34 For 1938.

35 Coverage notably incomplete in earlier years.

36 For 1933-34.

37 For Curaçao, Aruba and Bonaire only.

38 Excluding tribal Indian population, and also data for Canal Zone shown separately above.

39 According to test of birth registration, 86.5 per cent complete in 1940.

40 Beginning 1951, final rates are based on a 50 per cent sample of births.

41 Prior to 1933, birth-registration states only; by 1932, these states included 95 per cent of the total population. 1940-46: rates computed on population including armed forces outside country.

42 According to test of birth registration, 92.5 per cent complete in 1940 and 97.9 per cent in 1950.

9. Taux bruts de natalité (suite)

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

1 La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

6 Pour 1922-24.

11 Pour 1931-34.

16 Pour 1936-39.

19 Les taux ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

21 Une évaluation du système a permis de conclure que l'enregistrement des naissances était complet dans une proportion de 92,1 pour cent en 1950.

22 Taux calculés d'après la population civile.

23 Pour 1921-24.

24 Non compris le Yukon, les Territoires du Nord-Ouest et, avant 1950, Terre-Neuve qui constitue la 10ème province du Dominion depuis le 1er avril 1949. Les taux comprennent les naissances d'enfants de Canadiens résidant provisoirement aux Etats-Unis; ils ne comprennent pas les naissances d'enfants de résidents américains temporairement au Canada.

25 Une évaluation du système a permis de conclure que l'enregistrement des naissances était complet dans une proportion de 98 pour cent en 1941.

26 1940-1946: taux calculés d'après la population civile.

27 Portée des données améliorée les dernières années.

28 Les taux comprennent les mort-nés.

29 Avant 1939, les taux ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

30 Taux reposant sur des données ajustées dans la proportion suivante pour compenser les lacunes de l'enregistrement: 1930-1939, 3 pour cent; 1940-1949, 2 pour cent; 1950, 1,5 pour cent.

31 Pour 1926-29.

32 Pour 1926-27.

33 Pour 1930-32.

34 Pour 1938.

35 Données très incomplètes pour les premières années.

36 Pour 1933-34.

37 Pour Curaçao, Aruba et Bonaire seulement.

38 Non compris les indiens groupés en tribus et, également, la Zone du Canal qui figure séparément ci-dessus.

39 Une évaluation du système a permis de conclure que l'enregistrement des naissances était complet dans une proportion de 86,5 pour cent en 1940.

40 Depuis 1951 les taux définitifs reposent sur un sondage à 50 pour cent des naissances.

41 Avant 1933, états pratiquant l'enregistrement des naissances seulement; en 1932, ces états comprenaient 95 pour cent de la population totale. 1940-1946: les taux ont été calculés d'après un chiffre de population comprenant les forces armées hors du pays.

42 Une évaluation du système a permis de conclure que l'enregistrement des naissances était complet dans une proportion de 92.5 pour cent en 1940 et de 97,9 pour cent en 1950.

9. Crude birth rates (continued)

45 For 1925, 1927-29.

46 Registration estimated to be 97 per cent complete.

47 Prior to 1948, rates exclude live-born infants dying within 24 hours of birth.

48 Compulsory civil registration initiated in 1940.

49 For 1937-39.

50 Beginning 1948, excluding aborigines, who comprise about one-tenth of the total population and for whom data are unreliable.

51 Rates based on births registered within two years of occurrence.

52 Rates exclude births in Galápagos Islands and Provinces of Napo Pastaza and Santiago Zamora, but are computed on the total population.

53 Excluding Indian jungle population, estimated at 350 000.

54 Excluding Negro and Indian population of the interior, estimated at 11 000 in 1921 and 25 700 in 1947.

55 Excluding Indian jungle population, estimated at 56 700 in 1950.

56 Colony only.

57 Prior to 1940, registration area only, representing 82.5 per cent of the total population at 1931 census. Beginning 1951, certain towns only, numbering 60 in 1951 and 1953 and 62 in 1952, and having a population of approximately 1.3 million.

58 Excluding tribal aborigines. Beginning 1949, also excluding foreigners.

59 Including Chandernagor, which became part of the Republic of India after plebiscite of 2 May 1950.

60 Prior to 1947, registration area of former British Provinces, representing approximately 75 per cent of former India, not including Burma. 1946: also excluding East Bengal. Beginning 1947, registration area of Republic of India.

61 Java and Madura only.

62 Prior to 1949, years ended 21 March.

63 Excluding Bedouin population in the Negev.

64 Prior to 1948, Jewish population of Palestine.

* Provisoire.

** Les taux pour certaines années de cette série ont été calculés sur des effectifs inférieurs à 50.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

1 La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

2 Les taux ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

3 Taux reposant sur les baptêmes inscrits sur les registres de l'église.

6 Pour 1922-24.

19 Les taux ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

22 Taux calculés d'après la population civile.

23 Pour 1921-24.

28 Les taux comprennent les mort-nés.

43 Pour 1932-34.

44 Pour 1922-23.

45 Pour 1925, 1927-29.

46 Enregistrement des naissances considéré comme complet dans une proportion de 97 pour cent.

47 Avant 1948, les taux ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

48 L'enregistrement obligatoire n'est entré en vigueur qu'en 1940.

49 Pour 1937-39.

50 Depuis 1948, non compris les aborigènes qui représentent un dixième environ de la population totale et pour lesquels les données sont sujettes à caution.

51 Taux reposant sur les naissances enregistrées dans un délai de deux ans.

52 Les taux ne comprennent pas les naissances survenues dans les Iles Galàpagos et dans les provinces de Napo Pastaza et de Santiago Zamora, bien qu'ils aient été calculés d'après la population totale.

53 Non compris la population indienne de la jungle estimée à 350 000 personnes.

54 Non compris la population nègre et indienne de l'intérieur estimée à 11 000 personnes en 1921 et à 25 700 en 1947.

55 Non compris la population indienne de la jungle estimée à 56 700 personnes en 1950.

56 Colonie seulement.

57 Avant 1940, territoire d'enregistrement seulement, comprenant 82,5 pour cent de la population totale au recensement de 1931. Depuis 1951, quelques villes seulement s'élevant à 60 en 1951 et 1953, à 62 en 1952, avec une population de 1 300 000 habitants environ.

58 Non compris les tribus aborigènes. Depuis 1949, non compris également les étrangers.

59 Y compris Chandernagor qui fait partie de la République de l'Inde depuis le plébiscite du 2 mai 1950.

60 Avant 1947 territoire d'enregistrement des anciennes provinces britanniques, représentant approximativement 75 pour cent de l'Inde avant le partage, non compris la Birmanie. 1946: non compris également la partie orientale du Bengale. Depuis 1947, territoire d'enregistrement de la République d l'Inde.

61 Java et Madoura seulement.

62 Avant 1949, années terminées le 21 mars.

63 Non compris les bédouins du Negeb.

64 Avant 1948, population juive de Palestine.

9. Crude birth rates (continued)

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

[2] Rates exclude live-born infants dying before registration of birth.

[6] For 1922-24.

[7] Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.

[16] For 1936-39.

[22] Rates computed on civilian population.

[23] For 1921-24.

[28] Rates include stillbirths.

[31] For 1926-29.

[43] For 1932-34.

[65] Japanese nationals in Japan only.

[66] Lebanese nationals only.

[67] Prior to 1941, territory of former British Malaya, i.e., including Singapore.

[68] Registration area only, representing about 90 per cent of the total population.

[69] Settled Moslem population of territory formerly under British Mandate. For rates among Jewish population, see Israel above.

[70] Present territory, i.e., excluding Amami Islands, which reverted to Japan 25 December 1953.

[71] Includes data for Amami Islands.

[72] Registration has improved under Registration Ordinance, operative since 1949, and is now believed to be 80 per cent complete.

[73] Prior to 1947, Singapore Island only.

[74] Excluding nomad and semi-nomad population, estimated at 288 400 in 1945.

[75] Excludes data for the 41 communes not under Belgian administration.

[76] Prior to 1941, excluding Southern Dobruja.

[77] 1940-1945: fluctuations in rates are attributable to conditions during the war.

[78] Excludes data for Alderney and Sark.

[79] Prior to 1948, excluding territory ceded by Hungary in 1947.

[80] Excludes data for civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at the end of 1948.

[81] Prior to 1951, Finnish nationals in Finland only.

[82] 1939-1942 and 1945: excluding Departments of Bas-Rhin, Haut-Rhin and Moselle; in 1943 and 1944, excluding Corsica also.

[83] Prior to 1947, territory of the Treaty of Versailles; January 1947-April 1949, present territory, excluding the commune of Kirrberg.

[84] Territory of 1937.

[85] Beginning 1951, West Berlin only.

[86] Prior to 1948, excluding Dodecanese. Beginning 1949, rates based on births which have been adjusted for incomplete geographic coverage; see Table 8.

[87] For 1928-29.

[88] Prior to 1948, including territory ceded to Czechoslovakia in 1947.

9. Taux bruts de natalité (suite)

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

[2] Les taux ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[6] Pour 1922-24.

[7] L'enregistrement des naissances est facultatif; il n'est considéré comme complet que pour la population non-indigène représentant une proportion relativement faible de la population totale.

[16] Pour 1936-39.

[22] Taux calculés d'après la population civile.

[23] Pour 1921-24.

[28] Les taux comprennent les mort-nés.

[31] Pour 1926-29.

[43] Pour 1932-34.

[65] Nationaux japonais au Japon seulement.

[66] Nationaux libanais seulement.

[67] Avant 1941, territoire de l'ancienne Malaisie britannique, c'est-à-dire, y compris Singapour.

[68] Territoire d'enregistrement seulement, comprenant environ 90 pour cent de la population totale.

[69] Population musulmane du territoire auparavant sous mandat britannique, à l'exclusion des nomades. Pour les taux relatifs à la population juive, voir Israël ci-dessus.

[70] Territoire actuel, c'est-à-dire, non compris les îles Amami rendues au Japon le 25 décembre 1953.

[71] Y compris les îles Amami.

[72] L'enregistrement s'est amélioré depuis l'entrée en vigueur de l'Ordonance d'Enregistrement en 1949 et est à présent considéré comme complet dans une proportion de 80 pour cent.

[73] Avant 1947, l'île de Singapour exclusivement.

[74] Non compris les nomades et semi-nomades estimés à 288 400 en 1945.

[75] Non compris les naissances dans les 41 communes qui n'étaient pas administrées par la Belgique.

[76] Avant 1941, non compris la Dobroudja méridionale.

[77] 1940-1945: les fluctuations du taux proviennent des conditions spéciales de la période de guerre.

[78] Non compris Alderney et Sercq.

[79] Avant 1948, non compris le territoire cédé par la Hongrie en 1947.

[80] Non compris les naissances parmi les civils étrangers vivant au Danemark sans permis de séjour, environ 200 000 en 1945 et 2 500 fin 1948.

[81] Avant 1951, nationaux finlandais en Finlande seulement.

[82] 1939-1942 et 1945: non compris le Bas-Rhin, le Haut-Rhin et la Moselle. 1943 et 1944: non compris le Bas-Rhin, le Haut-Rhin, la Moselle et la Corse.

[83] Avant 1947, territoire du Traité de Versailles; janvier 1947-avril 1949, territoire actuel non compris la commune de Kirrberg.

[84] Territoire de 1937.

[85] Depuis 1951, Berlin-Ouest seulement.

[86] Avant 1948, non compris le Dodécanèse. Depuis 1949 les taux reposent sur des données ajustées pour tenir compte des lacunes géographiques de l'enregistrement; voir tableau 8.

[87] Pour 1928-29.

[88] Avant 1948, y compris le territoire cédé à la Tchécoslovaquie en 1947.

9. Crude birth rates (continued)

[See headnote on page 252.]

* Provisional.

** Rates for some years in this series are computed on frequencies less than 50.

† Data known to be by year of registration rather than by year of occurrence.

[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

[6] For 1922-24.

[11] For 1931-34.

[19] Rates exclude live-born infants dying within 24 hours of birth.

[23] For 1921-24.

[26] 1940-1946: rates computed on civilian population.

[36] For 1933-34.

[40] Beginning 1951, final rates are based on a 50 per cent sample of births.

[89] Rates based on births registered within one year of occurrence.

[90] Prior to 1943, territory of 1924-1938. 1936-1950: rates computed on population including armed forces outside country and civilians following the troops.

[91] Prior to 1949, excluding villages of Elten and Tüddern. Rates include births occurring outside country if one or both parents are listed in a Netherlands population register.

[92] Rates include births to Norwegian residents temporarily in Sweden.

[93] Prior to 1947, territory of 1923-1937.

[94] Data less reliable before 1950.

[95] For 1935-38.

[96] Changing territory; for description see Table 2.

[97] Beginning 1943, British-US Zone only.

[98] 1940-1949: rates computed on population including armed forces outside country.

[99] 1940-1949: rates computed on population including armed forces outside country. Prior to 1939, births in England and Wales by year of registration.

[100] Prior to 1947, excluding territory ceded by Italy in 1947.

[101] Coverage for 1947 and 1948 is incomplete owing to post-war reorganization of Registrar's Service.

[102] Excluding full-blooded aborigines, estimated at 47 000 in 1944.

[103] Years ended 31 March.

[104] For 1930-33.

[105] Prior to 1949, rates include stillbirths.

[106] For 1935-37.

[107] Rates computed on population excluding military and administrative personnel and their dependents.

[108] Years ended 30 June.

[109] For 1935-36.

[110] Rates include stillbirths among Samoan population. 1938-1950: years ended 31 March.

[111] For 1923-24.

[112] For Samoan population only.

9. Taux bruts de natalité (suite)

[Voir note explicative à la page 252.]

* Provisoire.

** Les taux pour certaines années de cette série ont été calculés sur des effectifs inférieurs à 50.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

1 La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

6 Pour 1922-24.

11 Pour 1931-34.

19 Les taux ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

23 Pour 1921-24.

26 1940-1946: taux calculés d'après la population civile.

36 Pour 1933-34.

40 Depuis 1951 les taux définitifs reposent sur un sondage à 50 pour cent des naissances.

89 Taux reposant sur les naissances enregistrées dans un délai d'un an.

90 Avant 1943, territoire de 1924-1938. 1936-1950: taux calculés d'après un chiffre de population comprenant les forces armées hors du pays et les civils accompagnant les troupes.

91 Avant 1949, non compris les villages d'Elten et Tüddern. Les taux comprennent les naissances survenues à l'étranger si l'un des parents au moins est porté sur un registre néerlandais d'état civil.

92 Les taux comprennent les naissances parmi les norvégiens résidant temporairement en Suède.

93 Avant 1947, territoire de 1923-1937.

94 Données moins complètes avant 1950.

95 Pour 1935-38.

96 Territoire de l'époque, voir précisions au tableau 2.

97 Depuis 1943, zone anglo-américaine seulement.

98 1940-1949: taux calculés d'après un chiffre de population comprenant les forces armées hors du pays.

99 1940-1949: taux calculés d'après un chiffre de population comprenant les forces armées hors du pays. Avant 1939, les données relatives aux naissances pour l'Angleterre et le pays de Galles se rapportent à l'année de l'enregistrement.

100 Avant 1947, non compris le territoire cédé par l'Italie en 1947.

101 Données incomplètes pour 1947 et 1948 à la suite de la réorganisation, après guerre, des services de l'état civil.

102 Non compris les purs aborigènes estimés à 47 000 en 1944.

103 Années terminées le 31 mars.

104 Pour 1930-33.

105 Avant 1949, les taux comprennent les mort-nés.

106 Pour 1935-37.

107 Taux calculés d'après un chiffre de population ne comprenant pas les militaires et fonctionnaires ainsi que les personnes à leur charge.

108 Années terminées le 30 juin.

109 Pour 1935-36.

110 Les taux comprennent les mort-nés parmi les Samoans. 1938-1950: années terminées le 31 mars.

111 Pour 1923-24.

112 Samoans exclusivement.

10. Number of live births by age of mother : 1936 – 1953
Naissances vivantes selon l'âge de la mère : 1936 – 1953

[For evaluation of quality of data, see Table 8 and discussion, page 22. — Voir tableau 8 et page 65 pour des précisions sur la qualité des données.]

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[1] Data exclude live-born infants dying before registration of birth.
[2] Data are confinements resulting in live births.
[3] Data are confinements resulting in legitimate live births.
[4] "Non-Moroccan" population.
[5] Reason for discrepancy between this and corresponding figure in Table 8 not ascertained.

* Provisoire.
† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[1] Les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[2] Les données se rapportent aux accouchements d'enfants nés vivants.
[3] Les données se rapportent aux accouchements d'enfants légitimes nés vivants.
[4] Population non marocaine.
[5] L'origine de la disparité entre ce chiffre et la donnée correspondante du tableau 8 n'a pu être déterminée.

† Data known to be by year of registration rather than by year of occurrence.

[7] Prior to 1952, data exclude live-born infants dying within 24 hours of birth.

[8] Data include births of Tunisian children to European mothers, numbering 48 in 1943, 65 in 1944 and 186 in 1946.

[9] Data exclude illegitimate live births.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[7] Avant 1952, les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

[8] Les données comprennent les naissances d'enfants tunisiens de mères européennes s'élevant à 48 en 1943, 65 en 1944 et 186 en 1946.

[9] Les données ne comprennent pas les naissances vivantes d'enfants illégitimes.

10. Live births by age of mother (continued)
Naissances vivantes selon l'âge de la mère (suite)

† Data known to be by year of registration rather than by year of occurrence.

10 Excluding Yukon, Northwest Territories and Newfoundland. Data include births to Canadian residents temporarily in the United States; exclude births to US residents temporarily in Canada.

11 Data exclude 6 936 births registered in 1953, which occurred before 22 May 1950.

12 Large increase due to law facilitating delayed registration.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

10 Non compris le Yukon, les Territoires du Nord-Ouest et Terre-Neuve. Les données comprennent les naissances d'enfants de Canadiens résidant provisoirement aux Etats-Unis; elles ne comprennent pas les naissances d'enfants de résidents américains temporairement au Canada.

11 Les données ne comprennent pas 6 936 naissances enregistrées en 1953 et survenues avant le 22 mai 1950.

12 Augmentation importante attribuable à une loi facilitant l'enregistrement différé des naissances.

10. Live births by age of mother (continued)
Naissances vivantes selon l'âge de la mère (suite)

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[2] Data are confinements resulting in live births.

[13] Data relate to events among a sample population representing approximately 16 per cent of the total.

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[2] Les données se rapportent aux accouchements d'enfants nés vivants.

[13] Les données se rapportent aux naissances survenues dans un échantillon de la population représentant environ 16 pour cent du total.

10. Live births by age of mother (continued)
Naissances vivantes selon l'âge de la mère (suite)

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[2] Data are confinements resulting in live births.

[13] Data relate to events among a sample population representing approximately 16 per cent of the total.

[14] Excluding tribal Indian population, and also data for Canal Zone shown separately above.

[15] Data based on a 50 per cent sample.

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[2] Les données se rapportent aux accouchements d'enfants nés vivants.

[13] Les données se rapportent aux naissances survenues dans un échantillon de la population représentant environ 16 pour cent du total.

[14] Non compris les indiens groupés en tribus ainsi que la Zone du Canal qui figure séparément ci-dessus.

[15] Données reposant sur un sondage à 50 pour cent.

10. Live births by age of mother (continued)
Naissances vivantes selon l'âge de la mère (suite)

[15] Data based on a 50 per cent sample.
[16] Data exclude live-born infants dying within 24 hours of birth. Coverage notably incomplete, especially before initiation of compulsory civil registration in 1940.

[15] Données reposant sur un sondage à 50 pour cent.
[16] Les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures. Données très incomplètes surtout avant la mise en vigueur de l'enregistrement obligatoire en 1940.

10. Live births by age of mother (continued)
Naissances vivantes selon l'âge de la mère (suite)

† Data known to be by year of registration rather than by year of occurrence.
17 Data include births registered within two years of occurrence.
18 Statistics based on baptisms recorded in church registers.
19 Excluding Indian jungle population, estimated at 350 000.
20 Data include 730 stillbirths.
21 Data for separate age groups exclude a number of births not tabulated by age of mother; data for all ages include them.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
17 Les données comprennent les naissances enregistrées dans un délai de deux ans.
18 Statistiques reposant sur les baptêmes inscrits sur les registres de l'église.
19 Non compris la population indienne de la jungle estimée à 350 000 personnes.
20 Les données comprennent 730 mort-nés.
21 Les données relatives aux différents groupes d'âge ne comprennent pas un certain nombre de naissances qui n'ont pas été réparties selon l'âge de la mère; ces naissances sont comprises dans les données relatives à l'ensemble des âges ("Tous âges").

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[2] Data are confinements resulting in live births.

[9] Data exclude illegitimate live births.

[19] Excluding Indian jungle population, estimated at 350 000.

[21] Data for separate age groups exclude a number of births not tabulated by age of mother; data for all ages include them.

[22] Excluding Indian jungle population, estimated at 56 700 in 1950.

[23] Excluding tribal aborigines. Beginning 1949, also excluding foreigners. Reason for slight discrepancies between these data and corresponding figures shown in Table 8 not ascertained.

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[2] Les données se rapportent aux accouchements d'enfants nés vivants.

[9] Les données ne comprennent pas les naissances vivantes d'enfants illégitimes.

[19] Non compris la population indienne de la jungle estimée à 350 000 personnes.

[21] Les données relatives aux différents groupes d'âge ne comprennent pas un certain nombre de naissances qui n'ont pas été réparties selon l'âge de la mère; ces naissances sont comprises dans les données relatives à l'ensemble des âges ("Tous âges").

[22] Non compris la population indienne de la jungle estimée à 56 700 personnes en 1950.

[23] Non compris les aborigènes groupés en tribus. Depuis 1949, non compris également les étrangers. L'origine des légères disparités entre ces chiffres et les données correspondantes du tableau 8 n'a pu être déterminée.

10. Live births by age of mother (continued)

† Data known to be by year of registration rather than by year of occurrence.

2 Data are confinements resulting in live births.

24 Including Netherlands New Guinea.

25 Prior to 1948, Jewish population of Palestine. Prior to 1946, data are confinements resulting in live births or stillbirths.

26 Japanese nationals in Japan. Prior to 1943, including Okinawa; 1943, including Okinawa and Karafuto.

27 Data for separate age groups exclude "recognized illegitimates"; data for all ages include them.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

2 Les données se rapportent aux accouchements d'enfants nés vivants.

24 Y compris la Nouvelle-Guinée néerlandaise.

25 Avant 1948, population juive de Palestine. Avant 1946, les données se rapportent à des accouchements d'enfants nés vivants ou mort-nés.

26 Nationaux japonais au Japon. Avant 1943, y compris Okinawa; en 1943, y compris Okinawa et Karafuto.

27 Les données relatives aux différents groupes d'âge ne comprennent pas les "naissances d'enfants illégitimes reconnus". Ces naissances sont comprises dans les données relatives à l'ensemble des âges ("Tous âges").

† Data known to be by year of registration rather than by year of occurrence.

[28] Settled Moslem population of territory formerly under British mandate. Data are confinements resulting in live births or stillbirths. For births among Jewish population, see Israel above.

[29] Data exclude reported live births for which copy of certificate not received in central office.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[28] Population musulmane du territoire auparavant sous mandat britannique, à l'exclusion des nomades. Les données se rapportent aux accouchements d'enfants nés vivants ou mort-nés. Pour les naissances parmi la population juive, voir Israël, ci-dessus.

[29] Les données ne comprennent pas les naissances vivantes signalées, pour lesquelles la copie de l'acte de naissance n'est pas parvenue au bureau central de statistique.

[30] Data for separate age groups exclude live-born infants dying before registration of birth; data for all ages include them.
[31] Excluding the 41 communes not under Belgian administration.
[32] Prior to 1941, excluding Southern Dobruja. Beginning 1942, data are legitimate live births and stillbirths.
[33] Excluding territory ceded by Hungary in 1947.
[34] Excluding civilian aliens living in Denmark without residence permits numbering about 200 000 in 1945 and about 2 500 at the end of 1948.

[30] Les données relatives aux différents groupes d'âge ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance; ces naissances sont comprises dans les données relatives à l'ensemble des âges ("Tous âges").
[31] Non compris les 41 communes qui n'étaient pas administrées par la Belgique.
[32] Avant 1941, non compris la Dobroudja méridionale. Depuis 1942, les données se rapportent aux naissances d'enfants légitimes nés vivants ou mort-nés.
[33] Non compris le territoire cédé par la Hongrie en 1947.
[34] Non compris les civils étrangers vivant au Danemark sans permis de séjour, environ 200 000 en 1945 et 2 500 fin 1948.

[1] Data exclude live-born infants dying before registration of birth.
[35] Prior to 1951, Finnish nationals in Finland only.
[36] Age of mother obtained by subtracting year of birth of mother from year of registration of child's birth.
[37] Excluding Departments of Bas-Rhin, Haut-Rhin and Moselle; in 1943 and 1944, excluding Corsica also.
[38] Prior to 1947, territory of the treaty of Versailles; January 1947-April 1949, present territory excluding the commune of Kirrberg.
[39] Age of mother obtained by subtracting year of birth of mother from year of birth of child or delivery of dead foetus.
[40] Data include stillbirths.

[1] Les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[35] Avant 1951, nationaux finlandais en Finlande seulement.
[36] L'âge de la mère a été obtenu en déduisant son année de naissance de l'année d'enregistrement de la naissance de l'enfant.
[37] Non compris le Bas-Rhin, le Haut-Rhin et la Moselle; en 1943 et 1944, non compris le Bas-Rhin, le Haut-Rhin, la Moselle et la Corse.
[38] Avant 1947, territoire du traité de Versailles; janvier 1947—avril 1949, territoire actuel non compris la commune de Kirrberg.
[39] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enfant ou de celle de l'accouchement du foetus mort.
[40] Les données comprennent les mort-nés.

† Data known to be by year of registration rather than by year of occurrence.
[39] Age of mother obtained by subtracting year of birth of mother from year of birth of child or delivery of dead foetus.
[40] Data include stillbirths.
[41] Territory of 1937. Data include stillbirths.
[42] Excluding Dodecanese.
[43] Including territory ceded to Czechoslovakia in 1947.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[39] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enfant ou de celle de l'accouchement du foetus mort.
[40] Les données comprennent les mort-nés.
[41] Territoire de 1937. Les données comprennent les mort-nés.
[42] Non compris le Dodécanèse.
[43] Y compris le territoire cédé à la Tchécoslovaquie en 1947.

[44] Prior to 1943, territory of 1924-1938.

[45] Prior to 1949, excluding villages of Elten and Tüddern. Data include births occurring outside country if one or both parents are listed in a Netherlands population register.

[44] Avant 1943, territoire de 1924-1938.

[45] Avant 1949, non compris les villages d'Elten et de Tüddern. Les données comprennent les enfants nés hors du pays si l'un des parents au moins est porté sur un registre d'état civil néerlandais.

10. Live births by age of mother (continued)
Naissances vivantes selon l'âge de la mère (suite)

[See headnote on page 262. — Voir note explicative à la page 262.]

[45] Prior to 1949, excluding villages of Elten and Tüddern. Data include births occurring outside country if one or both parents are listed in a Netherlands population register.

[46] Data include births to Norwegian residents temporarily in Sweden.

[47] Changing territory; for description see Table 2.

[45] Avant 1949, non compris les villages d'Elten et de Tüddern. Les données comprennent les enfants nés hors du pays si l'un des parents au moins est porté sur un registre d'état civil néerlandais.

[46] Les données comprennent les naissances parmi les Norvégiens résidant temporairement en Suède.

[47] Territoire de l'époque, voir précisions au tableau 2.

[47] Changing territory; for description see Table 2.
[48] Data for separate age groups exclude live-born infants dying within 24 hours of birth; data for all ages include them.
[49] Prior to 1951, data are confinements resulting in live births or stillbirths.

[47] Territoire de l'époque, voir précisions au tableau 2.
[48] Les données relatives aux différents groupes d'âge ne comprennent pas les enfants nés vivants décédés dans les 24 heures; ceux-ci sont compris dans les données relatives à l'ensemble des âges ("Tous âges").
[49] Avant 1951, les données se rapportent aux accouchements d'enfants nés vivants ou mort-nés.

10. Live births by age of mother (continued)
Naissances vivantes selon l'âge de la mère (suite)

[See headnote on page 262. — Voir note explicative à la page 262.]

† Data known to be by year of registration rather than by year of occurrence.

50 Prior to 1948, commune of Trieste; beginning 1948, British-US Zone.

51 Data are based on revised returns and differ slightly from those shown in Table 8.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

50 Avant 1948, commune de Trieste; depuis 1948, zone anglo-américaine.

51 Les données reposent sur des chiffres rectifiés et diffèrent légèrement de celles du tableau 8.

† Data known to be by year of registration rather than by year of occurrence.

[40] Data include stillbirths.

[51] Data are based on revised returns and differ slightly from those shown in Table 8.

[52] Excluding full-blooded aborigines, estimated at 47 000 in 1944. Prior to 1946, data are confinements resulting in live births.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[40] Les données comprennent les mort-nés.

[51] Les données reposent sur des chiffres rectifiés et diffèrent légèrement de celles du tableau 8.

[52] Non compris les purs aborigènes estimés à 47 000 en 1944. Avant 1946, les données se rapportent aux accouchements d'enfants nés vivants.

[12] Rates based on a 50 per cent sample of births.
[13] Rates based on births registered within two years of occurrence.
[14] Excluding Indian jungle population, estimated at 350 000.
[15] Rates include 730 stillbirths. Age-specific rates exclude 1 787 births not tabulated by age of mother; rate for all ages includes them.

* Provisoire.
† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.
[2] Les taux reposent sur le nombre d'enfants nés vivants de femmes au-dessous de 15 ans mais ont été calculés d'après la population féminine de 10 à 14 ans.
[3] Les taux reposent sur le nombre d'enfants nés vivants de femmes âgées de 45 ans et plus mais ont été calculés d'après la population féminine de 45 à 49 ans.
[11] Non compris les indiens groupés en tribus et, également, la Zone du Canal.
[12] Taux reposant sur un sondage à 50 pour cent.
[13] Taux reposant sur les naissances enregistrées dans un délai de deux ans.
[14] Non compris la population indienne de la jungle estimée à 350 000 personnes.
[15] Les taux comprennent 730 mort-nés. Les taux par âge ne comprennent pas 1 787 naissances qui n'ont pas été réparties selon l'âge de la mère; ces naissances sont comprises dans le taux "Tous âges".

[1] Rates based on live births to women of all ages but computed on female population aged 10-49.
[2] Rates based on live births to women under 15 years of age but computed on female population aged 10-14.
[3] Rates based on live births to women aged 45 and over but computed on female population aged 45-49.
[4] Rates exclude live-born infants dying before registraton of birth.
[23] Prior to 1951, Finnish nationals in Finland only.
[24] Age of mother obtained by subtracting year of birth of mother from year of registration of child's birth.
[25] Excluding Departments of Bas-Rhin, Haut-Rhin and Moselle; 1943 and 1944, excluding Corsica also.

[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.
[2] Les taux reposent sur le nombre d'enfants nés vivants de femmes au-dessous de 15 ans mais ont été calculés d'après la population féminine de 10 à 14 ans.
[3] Les taux reposent sur le nombre d'enfants nés vivants de femmes âgées de 45 ans et plus mais ont été calculés d'après la population féminine de 45 à 49 ans.
[4] Les taux ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[23] Avant 1951, nationaux finlandais en Finlande seulement.
[24] L'âge de la mère a été obtenu en déduisant son année de naissance de l'année d'enregistrement de la naissance de l'enfant.
[25] Non compris le Bas-Rhin, le Haut-Rhin et la Moselle. En 1943 et 1944, non compris le Bas-Rhin, le Haut-Rhin, la Moselle et la Corse.

* Provisional.
[1] Rates based on live births to women of all ages but computed on female population aged 10-49.
[2] Rates based on live births to women under 15 years of age but computed on female population aged 10-14.
[3] Rates based on live births to women aged 45 and over but computed on female population aged 45-49.
[26] Age of mother obtained by subtracting year of birth of mother from year of birth of child or delivery of dead foetus.
[27] Territory of 1937. Rates include stillbirths.
[28] Prior to 1951, rates include stillbirths.
[29] Including territory ceded to Czechoslovakia in 1947.
[30] Prior to 1943, territory of 1924-1938.

* Provisoire.
[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.
[2] Les taux reposent sur le nombre d'enfants nés vivants de femmes au-dessous de 15 ans mais ont été calculés d'après la population féminine de 10 à 14 ans.
[3] Les taux reposent sur le nombre d'enfants nés vivants de femmes âgées de 45 ans et plus mais ont été calculés d'après la population féminine de 45 à 49 ans.
[26] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enfant ou de celle de l'accouchement du foetus mort.
[27] Territoire de 1937. Les données comprennent les mort-nés.
[28] Avant 1951, les données comprennent les mort-nés.
[29] Y compris le territoire cédé à la Tchécoslovaquie en 1947.
[30] Avant 1943, territoire de 1924-1938.

[1] Rates based on live births to women of all ages but computed on female population aged 10-49.
[2] Rates based on live births to women under 15 years of age but computed on female population aged 10-14.
[3] Rates based on live births to women aged 45 and over but computed on female population aged 45-49.
[31] Prior to 1949, excluding villages of Elten and Tüddern. Rates include births occurring outside country if one or both parents are listed in a Netherlands population register.
[32] Rates include births to Norwegian residents temporarily in Sweden.

[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.
[2] Les taux reposent sur le nombre d'enfants nés vivants de femmes au-dessous de 15 ans mais ont été calculés d'après la population féminine de 10 à 14 ans.
[3] Les taux reposent sur le nombre d'enfants nés vivants de femmes âgées de 45 ans et plus mais ont été calculés d'après la population féminine de 45 à 49 ans.
[31] Avant 1949, non compris les villages d'Elten et de Tüddern. Les taux comprennent les enfants nés hors du pays si l'un des parents au moins est porté sur un registre d'état civil néerlandais.
[32] Les taux comprennent les naissances parmi les norvégiens résidant temporairement en Suède.

[1] Rates based on live births to women of all ages but computed on female population aged 10-49.
[2] Rates based on live births to women under 15 years of age but computed on female population aged 10-14.
[3] Rates based on live births to women aged 45 and over but computed on female population aged 45-49.
[33] Age-specific rates exclude live-born infants dying within 24 hours of birth; rate for all ages includes them.
[34] Prior to 1951, rates based on confinements resulting in live births or stillbirths.

[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.
[2] Les taux reposent sur le nombre d'enfants nés vivants de femmes au-dessous de 15 ans mais ont été calculés d'après la population féminine de 10 à 14 ans.
[3] Les taux reposent sur le nombre d'enfants nés vivants de femmes âgées de 45 ans et plus mais ont été calculés d'après la population féminine de 45 à 49 ans.
[33] Le taux "tous âges" comprend les enfants nés vivants décédés dans les 24 heures; les taux par âge ne les comprennent pas.
[34] Avant 1951, les taux reposent sur les accouchements d'enfants nés vivants ou mort-nés.

† Data known to be by year of registration rather than by year of occurrence.

[1] Rates based on live births to women of all ages but computed on female population aged 10-49.

[2] Rates based on live births to women under 15 years of age but computed on female population aged 10-14.

[3] Rates based on live births to women aged 45 and over but computed on female population aged 45-49.

[35] British-US Zone only.

[36] Rates computed on civilian population.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.

[2] Les taux reposent sur le nombre d'enfants nés vivants de femmes au-dessous de 15 ans mais ont été calculés d'après la population féminine de 10 à 14 ans.

[3] Les taux reposent sur le nombre d'enfants nés vivants de femmes âgées de 45 ans et plus mais ont été calculés d'après la population féminine de 45 à 49 ans.

[35] Zone anglo-américaine seulement.

[36] Taux calculés d'après la population civile.

11. Birth rates specific for age of mother (continued)
Taux de natalité selon l'âge de la mère (suite)

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[5] Excluding Yukon, Northwest Territories and Newfoundland. Data include births to Canadian residents temporarily in the United States; exclude births to US residents temporarily in Canada.
[6] Increase due to law facilitating delayed registration.

* Provisoire.
† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[5] Non compris le Yukon, les Territoires du Nord-Ouest et Terre-Neuve. Les données comprennent les naissances d'enfants de Canadiens résidant provisoirement aux Etats-Unis; elles ne comprennent pas les naissances d'enfants de résidents américains temporairement au Canada.
[6] Augmentation attribuable à une loi facilitant l'enregistrement différé des naissances.

12. Number of legitimate live births by age of mother (continued)
Naissances vivantes légitimes selon l'âge de la mère (suite)

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[7] Data are confinements resulting in legitimate live births.
[8] Excluding tribal Indian population, and also data for Canal Zone.
[9] Data are the difference between an estimated number of illegitimate live births (based on reports from a varying number of states) and the total live births which occurred. Because of rounding, totals are not the sum of the parts.
[10] Statistics based on baptisms recorded in church registers.
[11] Excluding Indian jungle population, estimated at 56 700 in 1950.
[12] Data include 18 439 "recognized" illegitimate live births.

* Provisoire.
† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[7] Les données se rapportent aux accouchements d'enfants légitimes nés vivants.
[8] Non compris les indiens groupés en tribus ainsi que la Zone du Canal.
[9] Les données représentent la différence entre une estimation du nombre des naissances vivantes illégitimes (reposant sur les déclarations faites dans un nombre variable d'états) et l'ensemble des naissances vivantes. Comme les chiffres ont été arrondis, les totaux ne correspondent pas à la somme des éléments.
[10] Statistiques reposant sur les baptêmes inscrits sur les registres de l'église.
[11] Non compris la population indienne de la jungle estimée à 56 700 personnes en 1950.
[12] Les données comprennent 18 439 naissances vivantes d'enfants illégitimes "reconnus".

12. Number of legitimate live births by age of mother (continued)

Naissances vivantes légitimes selon l'âge de la mère (suite)

[1] Data exclude live-born infants dying before registration of birth.
[7] Data are confinements resulting in legitimate live births.
[13] Japanese nationals in Japan only.
[14] Data exclude reported live births for which copy of certificate not received in central office.
[15] Excluding civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at the end of 1948.

[1] Les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[7] Les données se rapportent aux accouchements d'enfants légitimes nés vivants.
[13] Nationaux japonais au Japon seulement.
[14] Les données ne comprennent pas les naissances vivantes signalées, pour lesquelles la copie de l'acte de naissance n'est pas parvenue au bureau central de statistique.
[15] Non compris les civils étrangers vivant au Danemark sans permis de séjour, environ 200 000 en 1945 et 2 500 fin 1948.

12. Number of legitimate live births by age of mother (continued)
Naissances vivantes légitimes selon l'âge de la mère (suite)

[1] Data exclude live-born infants dying before registration of birth.
[16] Prior to 1951, Finnish nationals in Finland only.
[17] Age of mother obtained by subtracting year of birth of mother from year of registration of child's birth.
[18] Excluding Departments of Bas-Rhin, Haut-Rhin and Moselle; 1943 and 1944, excluding Corsica also.
[19] Age of mother obtained by subtracting year of birth of mother from year of birth of child.
[20] Age of mother obtained by subtracting year of birth of mother from year of birth of child or delivery of dead foetus.
[21] Data include legitimate stillbirths.

[1] Les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[16] Avant 1951, nationaux finlandais en Finlande seulement.
[17] L'âge de la mère a été obtenu en déduisant son année de naissance de l'année d'enregistrement de la naissance de l'enfant.
[18] Non compris le Bas-Rhin, le Haut-Rhin et la Moselle; en 1943 et 1944, non compris le Bas-Rhin, le Haut-Rhin, la Moselle et la Corse.
[19] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enfant.
[20] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enfant ou de celle de l'accouchement du foetus mort.
[21] Les données comprennent les mort-nés légitimes.

12. Number of legitimate live births by age of mother (continued)

Naissances vivantes légitimes selon l'âge de la mère (suite)

† Data known to be by year of registration rather than by year of occurrence.
[22] Excluding Dodecanese.
[23] Territory of 1924–1938.
[24] Prior to 1949, excluding villages of Elten and Tüddern. Data include births occurring outside country if one or both parents are listed in a Netherlands population register.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[22] Non compris le Dodécanèse.
[23] Territoire de 1924–1938.
[24] Avant 1949, non compris les villages d'Elten et de Tüddern. Les données comprennent les enfants nés hors du pays si l'un des parents au moins est porté sur un registre néerlandais d'état civil.

[25] Data include births to Norwegian residents temporarily in Sweden.
[26] Data exclude live-born infants dying within 24 hours of birth.
[27] Prior to 1951, data are confinements resulting in legitimate live births or stillbirths.
[28] British-US Zone only.

[25] Les données comprennent les naissances parmi les Norvégiens résidant temporairement en Suède.
[26] Les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures.
[27] Avant 1951 les données se rapportent aux accouchements d'enfants légitimes nés vivants ou mort-nés.
[28] Zone anglo-américaine seulement.

12. Number of legitimate live births by age of mother (continued)

Naissances vivantes légitimes selon l'âge de la mère (suite)

† Data known to be by year of registration rather than by year of occurrence.
[1] Rates based on legitimate live births to women of all ages but computed on married female population aged 10–49.
[2] Rates based on legitimate live births to women under 15 years of age but computed on married female population aged 10–14.
[3] Rates based on legitimate live births to women aged 45 and over but computed on married female population aged 45–49.
[4] Rates exclude live-born infants dying before registration of birth.
[5] Former mandated territory (Union of South Africa).
[6] Excluding Yukon, Northwest Territories and Newfoundland. Rates include births to Canadian residents temporarily in the United States; exclude births to US residents temporarily in Canada.
[7] Rates based on an estimated number of legitimate live births, adjusted for incomplete geographic coverage; see Table 12. Rates computed on population including persons consensually married.
[8] Excluding civilian aliens living in Denmark without residence permits, numbering about 200 000.
[9] Finnish nationals in Finland only.
[10] Age of mother obtained by subtracting year of birth of mother from year of registration of child's birth.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[1] Les taux reposent sur l'ensemble des naissances vivantes légitimes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.
[2] Les taux reposent sur le nombre d'enfants légitimes nés vivants de femmes au-dessous de 15 ans, mais ont été calculés d'après la population féminine de 10 à 14 ans.
[3] Les taux reposent sur le nombre d'enfants légitimes nés vivants de femmes âgées de 45 ans et plus, mois ont été calculés d'après la population féminine de 45 à 49 ans.
[4] Les taux ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[5] Territoire auparavant sous mandat (Union Sud-Africaine).
[6] Non compris le Yukon, les Territoires du Nord-Ouest et Terre-Neuve. Les taux comprennent les naissances d'enfants de Canadiens résidant temporairement aux Etats-Unis; ils ne comprennent pas les naissances d'enfants de résidents américains temporairement au Canada.
[7] Taux reposant sur une estimation du nombre des naissances vivantes légitimes ajustée pour tenir compte des lacunes géographiques de l'enregistrement; voir tableau 12. Taux calculés d'après un chiffre de population comprenant les unions consensuelles.
[8] Non compris les civils étrangers vivant au Danemark sans permis de séjour, au nombre de 200 000 environ.
[9] Nationaux finlandais en Finlande seulement.
[10] L'âge de la mère a été obtenu en déduisant son année de naissance de l'année d'enregistrement de la naissance de l'enfant.

[1] Rates based on legitimate live births to women of all ages but computed on married female population aged 10–49.
[2] Rates based on legitimate live births to women under 15 years of age but computed on married female population aged 10–14.
[3] Rates based on legitimate live births to women aged 45 and over but computed on married female population aged 45–49.
[11] Rates include legitimate stillbirths. Age of mother obtained by subtracting year of birth of mother from year of birth of child or delivery of dead foetus.
[12] Territory of 1924–1938.
[13] Prior to 1949, excluding villages of Elten and Tüddern. Rates include births outside country if one or both parents are listed in a Netherlands population register.
[14] Rates include births to Norwegian residents temporarily in Sweden.
[15] Rates based on confinements resulting in legitimate live births or stillbirths.
[16] British-US Zone only.

[1] Les taux reposent sur l'ensemble des naissances vivantes légitimes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.
[2] Les taux reposent sur le nombre d'enfants légitimes nés vivants de femmes au-dessous de 15 ans, mais ont été calculés d'après la population féminine de 10 à 14 ans.
[3] Les taux reposent sur le nombre d'enfants légitimes nés vivants de femmes âgées de 45 ans et plus, mais ont été calculés d'après la population féminine de 45 à 49 ans.
[11] Les taux comprennent les mort-nés légitimes. L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enfant ou de celle de l'accouchement du foetus mort.
[12] Territoire de 1924–1938.
[13] Avant 1949, non compris les villages d'Elten et de Tüddern. Les taux comprennent les enfants nés hors du pays si l'un des parents au moins est porté sur un registre d'état civil néerlandais.
[14] Les taux comprennent les naissances vivantes parmi les Norvégiens résidant temporairement en Suède.
[15] Taux reposant sur les accouchements d'enfants légitimes nés vivants ou mort-nés.
[16] Zone anglo-américaine seulement.

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[1] Data exclude live-born infants dying before registration of birth.
[2] Data exclude illegitimate live births.
[3] Data are confinements resulting in live births.
[4] "Non-Moroccan" population.

* Provisoire.
† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[1] Les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[2] Les données ne comprennent pas les naissances vivantes illégitimes.
[3] Les données se rapportent aux accouchements d'enfants nés vivants.
[4] Population "non marocaine".

† Data known to be by year of registration rather than by year of occurrence.
[2] Data exclude illegitimate live births.
[8] Excluding Yukon, Northwest Territories and Newfoundland. Data include births to Canadian residents temporarily in the United States; exclude births to US residents temporarily in Canada.
[9] Data exclude 6 936 live births registered in 1953, which occurred before 22 May 1950.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[2] Les données ne comprennent pas les naissances vivantes illégitimes.
[8] Non compris le Yukon, les Territoires du Nord-Ouest et Terre-Neuve. Les données comprennent les naissances d'enfants de Canadiens résidant provisoirement aux Etats-Unis; elles ne comprennent pas les naissances d'enfants de résidents américains temporairement au Canada.
[9] Les données ne comprennent pas 6 936 naissances vivantes enregistrées en 1953 et survenues avant le 22 mai 1950.

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[2] Data exclude illegitimate live births.
[3] Data are confinements resulting in live births.
[10] Data are confinements resulting in live births, except those resulting in illegitimate live births for which age of father is unknown.
[11] Data exclude illegitimate live births for which age of father is unknown.
[12] Reason for discrepancy between this and corresponding figure in Table 8 not ascertained.
[13] Excluding triball ndian population, and also data for Canal Zone shown separately above.

* Provisoire.
† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[2] Les données ne comprennent pas les naissances vivantes illégitimes.
[3] Les données se rapportent aux accouchements d'enfants nés vivants.
[10] Les données se rapportent aux accouchements d'enfants nés vivants à l'exception des illégitimes dont on ne connaît pas l'âge du père.
[11] Les données ne comprennent pas les naissances vivantes d'enfants illégitimes dont on ne connaît pas l'âge du père.
[12] L'origine de la disparité entre ce chiffre et la donnée correspondante du tableau 8 n'a pu être déterminée.
[13] Non compris les indiens groupés en tribus ainsi que la Zone du Canal qui figure séparément ci-dessus.

† Data known to be by year of registration rather than by year of occurrence.
[1] Data exclude live-born infants dying before registration of birth.
[2] Data exclude illegitimate live births.
[3] Data are confinements resulting in live births.
[20] Excluding tribal aborigines. Beginning 1949, also excluding foreigners. Data exclude illegitimate live births and those occurring after death of father.
[21] Prior to 1948, Jewish population of Palestine.
[22] Data are confinements resulting in live births or stillbirths.
[23] Japanese nationals in Japan only.
[24] Including Okinawa.
[25] Data exclude reported live births for which copy of certificate not received in central office.
[26] Excluding the 41 communes not under Belgian administration.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[1] Les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[2] Les données ne comprennent pas les naissances vivantes illégitimes.
[3] Les données se rapportent aux accouchements d'enfants nés vivants.
[20] Non compris les aborigènes groupés en tribus. Depuis 1949, non compris également les étrangers. Les données ne comprennent pas les naissances vivantes illégitimes et celles survenues après la mort du père.
[21] Avant 1948, population juive de Palestine.
[22] Les données se rapportent aux accouchements d'enfants nés vivants ou mort-nés.
[23] Nationaux japonais au Japon seulement.
[24] Y compris Okinawa.
[25] Les données ne comprennent pas les naissances vivantes signalées, pour lesquelles la copie de l'acte de naissance n'est pas parvenue au bureau central de statistique.
[26] Non compris les 41 communes qui n'étaient pas administrées par la Belgique.

14. Live births by age of father (continued) — Naissances vivantes selon l'âge du père (suite)

[2] Data exclude illegitimate live births.
[6] Data exclude live-born infants dying within 24 hours of birth.
[7] Beginning 1941, data exclude illegitimate live births.
[30] Prior to 1949, excluding villages of Elten and Tüddern. Data include live births occurring outside country if one or both parents are listed in a Netherlands population register.

[2] Les données ne comprennent pas les naissances vivantes illégitimes.
[6] Les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures.
[7] Depuis 1941, les données ne comprennent pas les naissances vivantes illégitimes.
[30] Avant 1949, non compris les villages d'Elten et de Tüddern. Les données comprennent les naissances vivantes survenues hors du pays si l'un des parents au moins de l'enfant est porté sur un registre d'état civil néerlandais.

† Data known to be by year of registration rather than by year of occurrence.
[2] Data exclude illegitimate live births.
[31] Data are confinements resulting in legitimate live births or stillbirths.
[32] British-US Zone only.
[33] Excluding full-blooded aborigines, estimated at 47 000 in 1944.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[2] Les données ne comprennent pas les naissances vivantes illégitimes.
[31] Les données se rapportent aux accouchements d'enfants légitimes nés vivants ou mort-nés.
[32] Zone anglo-américaine seulement.
[33] Non compris les purs aborigènes estimés à 47 000 en 1944.

[1] Rates based on live births to fathers of all ages, but computed on male population aged 15–64.
[2] Rates based on live births to fathers under 20 years of age, but computed on male population aged 15–19.
[3] Rates based on live births to fathers aged 50 or over, but computed on male population aged 50–64.
[4] Rates exclude live-born infants dying before registration of birth.
[5] Rates exclude illegitimate live births.
[6] "Non-Moroccan" population.
[7] Rates exclude live-born infants dying within 24 hours of birth.
[8] Former mandated territory (Union of South Africa).
[9] Excluding Yukon, Northwest Territories and Newfoundland. Rates include births to Canadian residents temporarily in the United States; exclude births to US residents temporarily in Canada.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population masculine de 15 à 64 ans.
[2] Les taux reposent sur le nombre d'enfants nés vivants ayant des pères de moins de 20 ans, mais ont été calculés d'après la population masculine de 15 à 19 ans.
[3] Les taux reposent sur le nombre d'enfants nés vivants ayant des pères de 50 ans et plus, mais ont été calculés d'après la population masculine de 50 à 64 ans.
[4] Les taux ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[5] Les taux ne comprennent pas les naissances vivantes illégitimes.
[6] Population "non marocaine".
[7] Les taux ne comprennent pas les enfants nés vivants décédés dans les 24 heures.
[8] Territoire auparavant sous mandat (Union Sud-Africaine).
[9] Non compris le Yukon, les Territoires du Nord-Ouest et Terre-Neuve. Les taux comprennent les naissances d'enfants de Canadiens résident temporairement aux Etats-Unis; ils ne comprennent pas les naissances d'enfants de résidents américains temporairement au Canada.

[1] Rates based on live births to fathers of all ages, but computed on male population aged 15–64.
[2] Rates based on live births to fathers under 20 years of age, but computed on male population aged 15–19.
[3] Rates based on live births to fathers aged 50 and over, but computed on male population aged 50–64.
[5] Rates exclude illegitimate live births.
[23] Prior to 1949, excluding villages of Elten and Tüddern. Rates include births occurring outside country if one or both parents are listed in a Netherlands population register.
[24] Rates based on confinements resulting in legitimate live births or stillbirths.

[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population masculine de 15 à 64 ans.
[2] Les taux reposent sur le nombre d'enfants nés vivants ayant des pères de moins de 20 ans, mais ont été calculés d'après la population masculine de 15 à 19 ans.
[3] Les taux reposent sur le nombre d'enfants nés vivants ayant des pères de 50 ans et plus, mais ont été calculés d'après la population masculine de 50 à 64 ans.
[5] Les taux ne comprennent pas les naissances vivantes illégitimes.
[23] Avant 1949, non compris les villages d'Elten et de Tüddern. Les taux comprennent les enfants nés hors du pays si l'un des parents au moins est porté sur un registre d'état civil néerlandais.
[24] Les taux reposent sur les accouchements d'enfants légitimes, nés vivants ou mort-nés.

15. Birth rates specific for age of father (continued)

† Data known to be by year of registration rather than by year of occurrence.
[1] Data exclude illegitimate live births and legitimate live-born infants dying before registration of birth.
[2] Birth order based on number of previous live births and stillbirths.
[3] Health bureau localities only.
[4] "Non-Moroccan" population.
[5] Basis for birth-order calculation not ascertained.
[6] Data exclude illegitimate live births.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[1] Les données ne comprennent pas les naissances vivantes illégitimes et les enfants légitimes nés vivants décédés avant l'enregistrement de leur naissance.
[2] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[3] Localités avec bureau d'hygiène seulement.
[4] Population "non marocaine".
[5] La base de calcul du rang de naissance n'a pu être déterminée.
[6] Les données ne comprennent pas les naissances vivantes illégitimes.

† Data known to be by year of registration rather than by year of occurrence.
[2] Birth order based on number of previous live births and stillbirths.
[5] Basis for birth-order calculation not ascertained.
[6] Data exclude illegitimate live births.
[7] Excluding Yukon, Northwest Territories and Newfoundland. Data include births to Canadian residents temporarily in the United States; exclude births to US residents temporarily in Canada.
[8] Data exclude 6 936 births registered in 1953, which occurred before 22 May 1950.
[9] Data are confinements resulting in live births.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[2] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[5] La base de calcul du rang de naissance n'a pu être déterminée.
[6] Les données ne comprennent pas les naissances vivantes illégitimes.
[7] Non compris le Yukon, les Territoires du Nord-Ouest et Terre-Neuve. Les données comprennent les naissances d'enfants de Canadiens résidant provisoirement aux Etats-Unis; elles ne comprennent pas les naissances d'enfants de résidents américains temporairement au Canada.
[8] Les données ne comprennent pas 6 936 naissances enregistrées en 1953 et survenues avant le 22 mai 1950.
[9] Les données se rapportent aux accouchements d'enfants nés vivants.

* Provisional.
[2] Birth order based on number of previous live births and stillbirths.
[5] Basis for birth-order calculation not ascertained.
[6] Data exclude illegitimate live births.
[10] Data are live births among a sample population representing approximately 16 per cent of the total.
[11] Excluding tribal Indian population, and also data for Canal Zone.
[12] Data based on a 50 per cent sample.

* Provisoire.
[2] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[5] La base de calcul du rang de naissance n'a pu être déterminée.
[6] Les données ne comprennent pas les naissances vivantes illégitimes.
[10] Les données se rapportent aux naissances vivantes survenues dans un échantillon de la population représentant environ 16 pour cent du total.
[11] Non compris les indiens groupés en tribus ainsi que la Zone du Canal.
[12] Données reposant sur un sondage à 50 pour cent.

† Data known to be by year of registration rather than by year of occurrence.
[5] Basis for birth-order calculation not ascertained.
[12] Data based on a 50 per cent sample.
[13] Data based on live births registered within two years of occurrence.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[5] La base de calcul du rang de naissance n'a pu être déterminée.
[12] Données reposant sur un sondage à 50 pour cent.
[13] Données reposant sur les naissances vivantes enregistrées dans un délai de deux ans.

† Data known to be by year of registration rather than by year of occurrence.
[1] Data exclude illegitimate live births and legitimate live-born infants dying before registration of birth.
[2] Birth order based on number of previous live births and stillbirths.
[17] Data are confinements resulting in live births or stillbirths.
[18] Settled Moslem population of territory formerly under British mandate. For births among Jewish population, see Israel above.
[19] Data exclude reported live births for which copy of certificate not received in central office.
[20] Bangkok and Thonburi municipalities only.
[21] Data are legitimate live births and stillbirths.
[22] Birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage.
[23] Birth order based on number of previous live births during existing marriage.
[24] Excluding the 41 communes not under Belgian administration.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[1] Les données ne comprennent pas les naissances vivantes illégitimes et les enfants légitimes nés vivants décédés avant l'enregistrement de leur naissance.
[2] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[17] Les données se rapportent aux accouchements d'enfants nés vivants ou mort-nés.
[18] Population musulmane du territoire auparavant sous mandat britannique, à l'exclusion des nomades. Pour les naissances parmi la population juive, voir Israël, à-dessus.
[19] Les données ne comprennent pas les naissances vivantes signalées, pour lesquelles la copie de l'acte de naissance n'est pas parvenue au bureau central de statistique.
[20] Municipalités de Bangkok et Thonburi seulement.
[21] Les données se rapportent aux naissances vivantes et mort-nés légitimes.
[22] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.
[23] Numéro d'ordre des naissances d'aprés le nombre de naissances vivantes antérieures du mariage en cours.
[24] Non compris les 41 communes qui n'étaient pas administrées par la Belgique.

[1] Data exclude illegitimate live births and legitimate live-born infants dying before registration of birth.
[5] Basis for birth-order calculation not ascertained.
[21] Data are legitimate live births and stillbirths.
[23] Birth order based on number of previous live births during existing marriage.
[25] Excluding territory ceded by Hungary in 1947.
[26] Birth order based on number of previous pregnancies resulting in live births or foetal deaths.
[27] Excluding civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at the end of 1948.
[28] Prior to 1951, Finnish nationals in Finland only. For legitimate live births, birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage; for illegitimate live births, based on previous illegitimate live births and stillbirths.

[1] Les données ne comprennent pas les naissances vivantes illégitimes et les enfants légitimes nés vivants décédés avant l'enregistrement de leur naissance.
[5] La base de calcul du rang de naissance n'a pu être déterminée.
[21] Les données se rapportent aux naissances vivantes et mort-nés légitimes.
[23] Numéro d'ordre des naissances d'aprés le nombre de naissances vivantes antérieures du mariage en cours.
[25] Non compris le territoire cédé par la Hongrie en 1947.
[26] Numéro d'ordre des naissances d'après le nombre de grossesses antérieures indépendamment du produit de la gestation.
[27] Non compris les civils étrangers vivant au Danemark sans permis de séjour, environ 200 000 en 1945 et 2 500 fin 1948.
[28] Avant 1951, nationaux finlandais en Finlande seulement. Pour les naissances vivantes d'enfants légitimes, numéro d'ordre d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours. Pour les naissances vivantes d'enfants illégitimes, numéro d'ordre d'après les naissances vivantes et mort-nés illégitimes antérieurs.

† Data known to be by year of registration rather than by year of occurrence.
[2] Birth order based on number of previous live births and stillbirths.
[5] Basis for birth-order calculation not ascertained.
[6] Data exclude illegitimate live births.
[21] Data are legitimate live births and stillbirths.
[22] Birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage.
[32] Excluding Dodecanese.
[33] Including territory ceded to Czechoslovakia in 1947.
[34] Birth order based on number of previous live births and stillbirths during existing marriage.
[35] Territory of 1924-1938.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[2] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[5] La base de calcul du rang de naissance n'a pu être déterminée.
[6] Les données ne comprennent pas les naissances vivantes illégitimes.
[21] Les données se rapportent aux naissances vivantes et mort-nés légitimes.
[22] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.
[32] Non compris le Dodécanèse.
[33] Y compris le territoire cédé à la Tchécoslovaquie en 1947.
[34] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs du mariage en cours.
[35] Territoire de 1924-1938.

[2] Birth order based on number of previous live births and stillbirths.
[6] Data exclude illegitimate live births.
[22] Birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage.
[34] Birth order based on number of previous live births and stillbirths during existing marriage.
[36] Prior to 1949, excluding villages of Elten and Tüddern. Rates include births occurring outside country if one or both parents are listed in a Netherlands population register. Prior to 1951, data are confinements resulting in legitimate live births or stillbirths.

[2] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[6] Les données ne comprennent pas les naissances vivantes illégitimes.
[22] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.
[34] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs du mariage en cours.
[36] Avant 1949, non compris les villages d'Elten et de Tüddern. Les taux comprennent les enfants nés hors du pays si l'un des parents au moins est porté sur un registre d'état civil néerlandais. Avant 1951, les données se rapportent aux accouchements d'enfants légitimes nés vivants ou mort-nés.

† Data known to be by year of registration rather than by year of occurrence.
[5] Basis for birth-order calculation not ascertained.
[12] Data based on a 50 per cent sample.
[42] Excluding full-blooded aborigines, estimated at 47 000 in 1944. Birth order based on the number of previous legitimate and legitimized live births during existing marriage.
[43] Data are confinements resulting in legitimate live births.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[5] La base de calcul du rang de naissance n'a pu être déterminée.
[12] Données reposant sur un sondage à 50 pour cent.
[42] Non compris les purs aborigènes estimés à 47 000 en 1944. Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.
[43] Les données se rapportent aux accouchements d'enfants légitimes nés vivants.

17. Birth rates by live-birth order : 1936 – 1953

Taux de natalité selon le rang de naissance : 1936 – 1953

[Rates are the number of live births in each birth order per 1 000 female population aged 10–49 years. Live-birth order is based on the number of previous live births to the mother. For evaluation of quality of data, see Table 8 and discussion, page 24.

Les taux représentent le nombre de naissances vivantes de chaque rang pour 1 000 femmes de 10 à 49 ans. Le rang de naissance est calculé d'après le nombre d'enfants déjà nés vivants de la mère. Voir tableau 8 et page 68 pour des précisions sur la qualité des données.]

† Data known to be by year of registration rather than by year of occurrence.

[1] Rates exclude illegitimate live births and legitimate live-born infants dying before registration of birth.

[2] Birth order based on number of previous live births and stillbirths.

[10] Prior to 1948, Jewish population of Palestine.

[12] Japanese nationals in Japan only.

[13] Rates based on legitimate live births and stillbirths.

[14] Birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage.

[15] Birth order based on number of previous live births during existing marriage.

[16] Excluding the 41 communes not under Belgian administration.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[1] Les taux ne comprennent pas les naissances vivantes illégitimes et les enfants légitimes nés vivant décédés avant l'enregistrement de leur naissance.

[2] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.

[10] Avant 1948, population juive de Palestine.

[12] Nationaux japonais au Japon seulement.

[13] Les taux reposent sur les naissances vivantes et mort-nés légitimes.

[14] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.

[15] Numéro d'ordre des naissances d'après le nombre de naissances vivantes antérieures du mariage en cours.

[16] Non compris les 41 communes qui n'étaient pas administrées par la Belgique.

[17] Birth order based on number of previous pregnancies resulting in live births or foetal deaths.

[18] Excluding civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at the end of 1948.

[19] Prior to 1951, Finnish nationals in Finland only. For legitimate live births, birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage; for illegitimate live births, based on previous illegitimate live births and stillbirths.

[17] Numéro d'ordre des naissances d'après le nombre de grossesses antérieures, indépendamment du produit de la gestation.

[18] Non compris les civils étrangers vivant au Danemark sans permis de séjour (environ 200 000 en 1945 et 2 500 fin 1948).

[19] Avant 1951, nationaux finlandais en Finlande seulement. Pour les naissances vivantes d'enfants légitimes, numéro d'ordre d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours. Pour les naissances vivantes d'enfants illégitimes, numéro d'ordre d'après les naissances vivantes et mort-nés illégitimes antérieurs.

* Provisional.
[2] Birth order based on number of previous live births and stillbirths.
[5] Rates exclude illegitimate live births.
[14] Birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage.
[23] Birth order based on number of previous live births and stillbirths during existing marriage.
[24] Territory of 1924–1938.
[25] Prior to 1949, excluding villages of Elten and Tüddern. Rates include births occurring outside country if one or both parents are listed in a Netherlands population register. Prior to 1951, rates based on confinements resulting in legitimate live births or stillbirths.

* Provisoire.
[2] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[5] Les taux ne comprennent pas les naissances vivantes d'enfants illégitimes.
[14] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.
[23] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs du mariage en cours.
[24] Territoire de 1924–1938.
[25] Avant 1949, non compris villages d'Elten et de Tüddern. Les taux comprennent les enfants nés hors du pays si l'un des parents au moins est porté sur un registre d'état civil néerlandais. Avant 1951, les taux reposent sur les accouchements d'enfants légitimes nés vivants ou mort-nés.

† Data known to by year of registration rather than by year of occurrence.
[2] Birth order based on number of previous live births and stillbirths.
[6] Basis for birth-order calculation not ascertained.
[30] Excluding full-blooded aborigines, estimated at 47 000 in 1944. Birth order based on number of previous legitimate and legitimized live births during existing marriage.
[31] Rates based on confinements resulting in legitimate live births.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[2] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[6] La base de calcul du rang de naissance n'a pu être déterminée.
[30] Non compris les purs aborigènes estimés à 47 000 en 1944. Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.
[31] Les taux reposent sur les accouchements d'enfants légitimes nés vivants.

[2] Birth order based on number of previous live births and stillbirths.
[6] Excluding Yukon, Northwest Territories and Newfoundland. Data include births to Canadian residents temporarily in the United States; exclude births to US residents temporarily in Canada.

[2] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[6] Non compris le Yukon, les Territoires du Nord-Ouest et Terre-Neuve. Les données comprennent les naissances d'enfants de Canadiens résidant provisoirement aux Etats-Unis; elles ne comprennent pas les naissances d'enfants de résidents américains temporairement au Canada.

18. Live births by age of mother and live-birth order (continued)

Naissances vivantes selon l'âge de la mère et le rang de naissance (suite)

[1] Data exclude illegitimate live births and legitimate live-born infants dying before registration of birth.
[2] Birth order based on number of previous live births and stillbirths.
[24] Reason for discrepancy between these data and corresponding figu re shown in Table 16 not ascertained.

[1] Les données ne comprennent pas les naissances vivantes illégitimes et les enfants légitimes nés vivants décédés avant l'enregistrement de leur naissance.
[2] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[24] L'origine des disparités entre ces données et les chiffres correspondants du tableau 16 n'a pu être déterminée.

[1] Data exclude illegitimate live births and legitimate live-born infants dying before registration of birth.
[2] Birth order based on number of previous live births and stillbirths.
[14] Data are legitimate live births and stillbirths.
[15] Birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage.
[25] Age of mother obtained by subtracting year of birth of mother from year of birth of child or delivery of dead foetus.

[1] Les données ne comprennent pas les naissances vivantes illégitimes et les enfants légitimes nés vivants décédés avant l'enregistrement de leur naissance.
[2] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[14] Les données se rapportent aux naissances vivantes et mort-nés légitimes.
[15] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.
[25] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enfant ou de celle de l'accouchement du foetus mort.

[5] Data exclude illegitimate live births.
[15] Birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage.
[25] Age of mother obtained by subtracting year of birth of mother from year of birth of child or delivery of dead foetus.

[5] Les données ne comprennent pas les naissances vivantes d'enfants illégitimes.
[15] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.
[25] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enfant ou de celle de l'accouchement du foetus mort.

[27] Birth order based on number of previous live births and stillbirths during existing marriage.

[29] Prior to 1949, excluding villages of Elten and Tüddern. Data include births occurring outside country if one or both parents are listed in a Netherlands population register.

[30] Data are confinements resulting in legitimate live births.

[27] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs du mariage en cours.

[29] Avant 1949, non compris les villages d'Elten et de Tüddern. Les données comprennent les naissances vivantes survenues hors du pays si l'un des parents au moins de l'enfant est porté sur un registre d'état civil néerlandais.

[30] Les données se rapportent aux accouchements d'enfants légitimes nés vivants.

18. Live births by age of mother and live-birth order (continued)

Naissances vivantes selon l'âge de la mère et le rang de naissance (suite)

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[30] Les données se rapportent aux accouchements d'enfants légitimes nés vivants.

[35] Non compris les purs aborigènes estimés à 47 000 en 1944. Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes er légitimés, du mariage en cours.

† Data known to be by year of registration rather than by year of occurrence.
[4] Basis for birth-order calculation not ascertained.
[30] Data are confinements resulting in legitimate live births.
[35] Excluding full-blooded aborigines, estimated at 47 000 in 1944. Birth order based on number of previous legitimate and legitimized live births during existing marriage.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[4] La base de calcul du rang de naissance n'a pu être déterminée.
[30] Les données se rapportent aux accouchements d'enfants légitimes nés vivants.
[35] Non compris les purs aborigènes estimés à 47 000 en 1944. Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.

19. Birth rates by live-birth order specific for age of mother : 1948 and 1951

Taux de natalité selon le rang de naissance et l'âge de la mère : 1948 et 1951

Rates are the number of live births in each birth order per 1 000 female population in specified age group. Live-birth order is based on the number of previous live births to the mother. For evaluation of quality of data, see Table 8 and discussion, page 25. —

Les taux représentent le nombre de naissances vivantes de chaque rang pour 1 000 femmes dans chaque groupe d'âge. Le rang de naissance est calculé d'après le nombre d'enfants déjà nés vivants de la mère. Voir tableau 8 et page 68 pour des précisions sur la qualité des données.]

[1] Rates based on live births to women of all ages but computed on female population aged 10–49.
[2] Rates based on live births to women under 15 years of age but computed on female population aged 10–14.
[3] Rates based on live births to women aged 45 and over but computed on female population aged 45–49.
[4] Rates exclude illegitimate live births and legitimate live-born children dying before registration of birth.
[5] Birth order based on number of previous live births and stillbirths.
[6] "Non-Moroccan" population.
[7] Excluding Yukon, Northwest Territories and Newfoundland. Data include births to Canadian residents temporarily in the United States; exclude births to US residents temporarily in Canada.

[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.
[2] Les taux reposent sur le nombre d'enfants nés vivants de femmes au-dessous de 15 ans mais ont été calculés d'après la population féminine de 10 à 14 ans.
[3] Les taux reposent sur le nombre d'enfants nés vivants de femmes âgées de 45 ans et plus mais ont été calculés d'après la population féminine de 45 à 49 ans.
[4] Les taux ne comprennent pas les naissances vivantes illégitimes et les enfants légitimes nés vivants décédés avant l'enregistrement de leur naissance.
[5] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[6] Population "non marocaine".
[7] Non compris le Yukon, les Territoires du Nord-Ouest et Terre-Neuve. Les données comprennent les naissances d'enfants de Canadiens résidant provisoirement aux Etats-Unis; elles ne comprennent pas les naissances d'enfants de résidents américains temporairement au Canada.

[4] Rates exclude illegitimate live births and legitimate live-born children dying before registration of birth.
[12] Birth order based on number of legitimate live-born children of existing marriage still living.
[13] Birth order based on number of previous pregnancies resulting in live births or foetal deaths.

[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.
[2] Les taux reposent sur le nombre d'enfants nés vivants de femmes au-dessous de 15 ans mais ont été calculés d'après la population féminine de 10 à 14 ans.
[3] Les taux reposent sur le nombre d'enfants nés vivants de femmes âgées de 45 ans et plus mais ont été calculés d'après la population féminine de 45 à 49 ans.
[4] Les taux ne comprennent pas les naissances vivantes illégitimes et les enfants légitimes nés vivants décédés avant l'enregistrement de leur naissance.
[12] Numéro d'ordre des naissances d'après le nombre d'enfants légitimes encore vivants du mariage en cours.
[13] Numéro d'ordre des naissances d'après le nombre de grossesses antérieures, indépendamment du produit de la gestation.

* Provisional.
[1] Rates based on live births to women of all ages but computed on female population aged 10–49.
[2] Rates based on live births to women under 15 years of age but computed on female population aged 10–14.
[3] Rates based on live births to women aged 45 and over but computed on female population aged 45–49.
[16] Rates exclude illegitimate live births.
[18] Birth order based on number of previous live births and stillbirths during existing marriage.
[19] Data include births occurring outside country if one or both parents are listed in a Netherlands population register.
[20] Excluding villages of Elten and Tüddern.

* Provisoire.
[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.
[2] Les taux reposent sur le nombre d'enfants nés vivants de femmes au-dessous de 15 ans mais ont été calculés d'après la population féminine de 10 à 14 ans.
[3] Les taux reposent sur le nombre d'enfants nés vivants de femmes âgées de 45 ans et plus mais ont été calculés d'après la population féminine de 45 à 49 ans.
[16] Les taux ne comprennent pas les naissances vivantes illégitimes.
[18] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs du mariage en cours.
[19] Les données comprennent les naissances survenues hors du pays si l'un des parents au moins de l'enfant est porté sur un registre d'état civil néerlandais.
[20] Non compris les villages d'Elten et de Tüddern.

19. Birth rates by live-birth order specific for age of mother (continued)

[1] Rates based on live births to women of all ages but computed on female population aged 10–49.
[2] Rates based on live births to women under 15 years of age but computed on female population aged 10–14.
[3] Rates based on live births to women aged 45 and over but computed on female population aged 45–49.
[16] Rates exclude illegitimate live births.
[18] Birth order based on number of previous live births and stillbirths during existing marriage.
[19] Data include births occurring outside country if one or both parents are listed in a Netherlands population register.
[21] Rates include births to Norwegian residents temporarily in Sweden.

[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.
[2] Les taux reposent sur le nombre d'enfants nés vivants de femmes au-dessous de 15 ans mais ont été calculés d'après la population féminine de 10 à 14 ans.
[3] Les taux reposent sur le nombre d'enfants nés vivants de femmes âgées de 45 ans et plus mais ont été calculés d'après la population féminine de 45 à 49 ans.
[16] Les taux ne comprennent pas les naissances vivantes illégitimes.
[18] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs du mariage en cours.
[19] Les données comprennent les naissances survenues hors du pays si l'un des parents au moins de l'enfant est porté sur un registre d'état civil néerlandais.
[21] Les taux comprennent les naissances parmi les Norvégiens résidant temporairement en Suède.

† Data known to be by year of registration rather than by year of occurrence.
[1] Rates based on live births to women of all ages but computed on female population aged 10–49.
[2] Rates based on live births to women under 15 years of age but computed on female population aged 10–14.
[3] Rates based on live births to women aged 45 and over but computed on female population aged 45–49.
[5] Birth order based on number of previous live births and stillbirths.
[24] Excluding full-blooded aborigines, estimated at 47 000 in 1944. Birth order based on number of previous legitimate and legitimized live births during existing marriage.
[25] Rates based on confinements resulting in legitimate live births.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[1] Les taux reposent sur l'ensemble des naissances vivantes ("Tous âges") mais ont été calculés d'après la population féminine de 10 à 49 ans.
[2] Les taux reposent sur le nombre d'enfants nés vivants de femmes au-dessous de 15 ans mais ont été calculés d'après la population féminine de 10 à 14 ans.
[3] Les taux reposent sur le nombre d'enfants nés vivants de femmes âgées de 45 ans et plus mais ont été calculés d'après la population féminine de 45 à 49 ans.
[5] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs.
[24] Non compris les purs aborigènes estimés à 47 000 en 1944. Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.
[25] Les taux reposent sur les accouchements d'enfants légitimes nés vivants

19. Birth rates by live-birth order specific for age of mother (continued)

[2] Duration of marriage is difference between year of marriage and year of birth of child or delivery of dead foetus.
[15] Prior to 1947, territory of the Treaty of Versailles; January 1947–April 1949, present territory, excluding the commune of Kirrberg.
[16] Territory of 1937.
[17] Data include legitimate stillbirths.
[18] Including territory ceded to Czechoslovakia in 1947.
[19] Territory of 1924–1938.

[2] La durée du mariage représente la différence entre l'année du mariage et celle de la naissance de l'enfant ou de l'accouchement du foetus mort.

[15] Avant 1947, territoire du traité de Versailles; janvier 1947–avril 1949, territoire actuel non compris la commune de Kirrberg.

[16] Territoire de 1937.

[17] Les données comprennent les mort-nés légitimes.

[18] Y compris le territoire cédé à la Tchécoslovaquie en 1947.

[19] Territoire de 1924–1938.

[2] Duration of marriage is difference between year of marriage and year of birth of child or delivery of dead foetus.

[11] Data are confinements resulting in legitimate! ive births or stillbirths.

[20] Prior to 1949, excluding villages of Elten and Tüddern. Data include births occurring outside country if one or both parents are listed in a Netherlands population register. Prior to 1952, duration of marriage is difference between year of marriage and year of birth of child or delivery of dead foetus.

[21] Data include births to Norwegian residents temporarily in Sweden.

[2] La durée du mariage représente la différence entre l'année du mariage et celle de la naissance de l'enfant ou de l'accouchement du foetus mort.

[11] Les données se rapportent aux accouchements d'enfants légitimes nés vivants ou mort-nés.

[20] Avant 1949, non compris les villages d'Elten et de Tüddern. Les taux comprennent les enfants nés hors du pays si l'un des parents au moins est porté sur un registre d'état civil néerlandais. Avant 1952, la durée du mariage représente la différence entre l'année du mariage et celle de la naissance de l'enfant ou de l'accouchement du foetus mort.

[21] Les données comprennent les naissances parmi les Norvégiens résidant temporairement en Suède.

[2] La durée du mariage représente la différence entre l'année du mariage et celle de la naissance de l'enfant ou de l'accouchement du foetus mort.

[11] Les données se rapportent aux accouchements d'enfants légitimes nés vivants ou mort-nés.

[21] Les données comprennent les naissances parmi les Norvégiens résidant temporairement en Suède.

20. Legitimate live births by duration of marriage (continued)

[1] Prior to 1951, rates based on distribution of births by age of mother estimated by applying average of rates for Finland, France and Union of South Africa. Net rates based on 1935-1937 life-table mortality.
[2] Based on 1945-1947 life-table mortality.
[3] Based on estimated distribution of births by age of mother.
[4] Rates adjusted for underregistration of births and for states not in registration area 1930-1932. Net rates for 1930 to 1939 based on life-table mortality of 1929-1931.
[5] Based on 50 per cent sample of live births.

[1] Avant 1951, les taux reposent sur la répartition des naissances selon l'âge de la mère établie en appliquant la moyenne des taux spécifiques de natalité pour la Finlande, la France et l'Union Sud-Africaine. Les taux nets reposent sur la table de mortalité des années 1935-1937.
[2] Taux reposant sur la table de mortalité des années 1945-1947.
[3] Taux reposant sur une estimation de la répartition des naissances selon l'âge de la mère.
[4] Taux ajustés pour compenser les lacunes de l'enregistrement des naissances et tenir compte des états ne faisant pas partie du territoire d'enregistrement en 1930-1932. Les taux nets pour 1930 à 1939 reposent sur la table de mortalité des années 1929-1931.
[5] Taux reposant sur un sondage à 50 pour cent des naissances vivantes.

[6] Net rates for 1930 to 1935 based on mortality of 1930; for 1936 to 1943, on that of 1940.

[7] Gross rates refer to married women only. Net rates are "Replacement rates", an approximation of the net reproduction rate, which measures the adequacy of number of female population under 5 to replace those 15-44.

[8] Based on average mortality of 1948-50.

[9] Prior to 1948, Jewish population of Palestine.

[10] Settled Moslem population of territory formerly under British mandate. Rates for 1931-37 based on estimated distribution of births by age of mother. Net rates 1931 to 1932 based on average mortality of 1930-32; those for 1933 to 1935, on that of 1933-35; for 1936 to 1938, on that of 1936-38; for 1939 and 1940, on that of 1939-41.

[11] Net rates based on average mortality of 1947-48.

[12] Net rates for 1939 to 1946 based on average mortality of 1928-32; beginning 1947, on that of 1946-49.

[13] Excluding data for the 41 communes not under Belgian administration.

[6] Les taux nets pour 1930 à 1935 reposent sur la mortalité de l'année 1930 et pour 1936 à 1943 sur celle de l'année 1940.

[7] Les taux bruts se rapportent aux femmes mariées seulement. Les taux nets sont des "taux de remplacement" plutôt que des taux de reproduction, c'est-à-dire qu'ils reflètent la mesure dans laquelle la population féminine au-dessous de 5 ans pourra remplacer celle de 15 à 44 ans.

[8] Taux reposant sur la mortalité moyenne des années 1948-50.

[9] Avant 1948, population juive de Palestine.

[10] Population musulmane du territoire auparavant sous mandat britannique, à l'exclusion des nomades. Les taux pour 1931-37 reposent sur une estimation de la répartition des naissances selon l'âge de la mère. Les taux nets pour 1931 à 1932 reposent sur la mortalité moyenne des années 1930-32; pour 1933 à 1935, sur celle des années 1933-35; pour 1936 à 1938, sur celle des années 1936-38 et, pour 1939 et 1940, sur celle des années 1939-1941.

[11] Les taux nets reposent sur la mortalité moyenne des années 1947-48.

[12] Les taux nets pour 1939 à 1946 reposent sur la mortalité moyenne des années 1928-32; depuis 1947, ces taux reposent sur celle des années 1946-49.

[13] Non compris les 41 communes qui n'étaient pas administrées par la Belgique.

[14] Territory of 1930. Net rates apparently based on 1929-1932 life-table mortality.

[15] Prior to 1936, net rates based on average mortality of 1931-35; beginning 1936, on that of 1936-40.

[16] Territory as of date. Net rates for 1936 to 1940 based on average mortality of 1936-40; those for 1941 to 1945, on that of 1941-45; for 1946 to 1950, on that of 1946-50; for 1951 to 1952, on that of 1950-51.

[17] 1939 to 1942, and 1945: 87 departments, excluding Bas-Rhin, Haut-Rhin and Moselle; 1943 and 1944: 86 departments, excluding Corsica also.

[18] Territory of 1937.

[19] Net rates based on average mortality of 1949-51.

[14] Territoire de 1930. Les taux nets reposent probablement sur la table de mortalité des années 1929-1932.

[15] Avant 1936, les taux nets reposent sur la mortalité moyenne des années 1931-35; depuis 1936, ces taux reposent sur celle des années 1936-40.

[16] Territoire de l'époque. Les taux nets pour 1936 à 1940 reposent sur la mortalité moyenne des années 1936-40; pour 1941 à 1945, sur celle des années 1941-45; pour 1946 à 1950, sur celle des années 1946-50 et, pour 1951 à 1952, sur celle des années 1950-51.

[17] De 1939 à 1942 et pour 1945: 87 départements, non compris le Bas-Rhin, le Haut-Rhin et la Moselle. 1943-1944: 86 départements, non compris le Bas-Rhin, le Haut-Rhin, la Moselle et la Corse.

[18] Territoire de 1937.

[19] Les taux nets reposent sur la mortalité moyenne des années 1949-51.

* Provisional.
[3] Based on estimated distribution of births by age of mother.
[20] Territory as of date.
[21] Net rates based on average mortality of 1931-40.
[22] Territory of 1924-1938.
[23] Net rates for 1921 to 1931 are estimates; those for 1932 to 1940, based on average mortality of 1931-35; for 1941 to 1949, on that of 1931-40; for 1950 to 1953, on that of 1947-49.
[24] Net rates for 1932 to 1935 based on average mortality of 1920-30; those for 1936 to 1951, on that of 1936-40; for 1952, on that of 1946-50.
[23] Net rates apparently based on the same life-table mortality throughout.

* Provisoire.
[3] Taux reposant sur une estimation de la répartition des naissances selon l'âge de la mère.
[20] Territoire de l'époque.
[21] Les taux nets reposent sur la mortalité moyenne des années 1931-40.
[22] Territoire de 1924-1938.
[23] Les taux nets pour 1921 à 1931 sont des estimations; pour 1932 à 1940 ils reposent sur la mortalité moyenne des années 1931-35; pour 1941 à 1949, sur celle des années 1931-40, et pour 1950 à 1953, sur celle des années 1947-49.
[24] Les taux nets pour 1932 à 1935 reposent sur la mortalité moyenne des années 1920-30; pour 1936, sur celle des années 1936-40 et, pour 1952, sur celle des années 1946-50.
[25] La série de taux nets repose probablement sur la même table de mortalité.

* Provisional.
[3] Based on estimated distribution of births by age of mother.
[26] Net rates for 1925 to 1944 based on average mortality of 1936-40; those for 1945 to 1949, on that of 1941-45; for 1950 to 1951, on that of 1946-50.
[27] Net rates for 1936 to 1941 based on average mortality of 1933-37; beginning 1942, on that of 1939-44.
[28] Prior to 1938, rates based on estimated distribution of births by age of mother. Net rates based on mortality projections revised in the light of 1946-1950 mortality experience of females under 45 years of age.

* Provisoire.
[3] Taux reposant sur une estimation de la répartition des naissances selon l'âge de la mère.
[26] Les taux nets pour 1925 à 1944 reposent sur la mortalité moyenne des années 1936-40; pour 1945 à 1949 sur celle des années 1941-45 et, pour 1950 à 1951, sur celle des années 1946-50.
[27] Les taux nets pour 1936 à 1941 reposent sur la mortalité moyenne des années 1933-37; depuis 1942, ces taux reposent sur celle des années 1939-44.
[28] Avant 1938, les taux reposent sur une estimation de la répartition des naissances selon l'âge de la mère. Les taux nets reposent sur des perspectives de mortalité corrigées d'après la mortalité effective, pour la période 1946-1950, des femmes de moins de 45 ans.

1951	1.640	1.578
1952	1.717	1.652
1953	1.696	1.632

* Provisional.

[29] Net rates for 1949 to 1952 based on average Slovenian mortality 1931-33 and of Austria 1906-10. 1953 rates are estimated.

[30] Excluding full-blooded aborigines estimated at 47 000 in 1944. Beginning 1946, net rates based on life-table mortality of 1946-48.

[31] Prior to 1950, net rates based on average mortality of 1934-38; beginning 1950 on that of 1950-52.

* Provisoire.

[29] Les taux nets pour 1949 à 1952 repose sur la mortalité moyenne slovène des années 1931-33 et sur celle de la population autrichienne de 1906 à 1910. Les taux pour 1953 sont des estimations.

[30] Non compris les purs aborigènes estimés à 47 000 en 1944. Depuis 1946, les taux nets reposent sur la table de mortalité des années 1946-48.

[31] Avant 1950 les taux nets reposent sur la mortalité moyenne des années 1934-38; depuis 1950, ils reposent sur celle des années 1950-52.

22. Number of stillbirths (late foetal deaths) : 1938–1953

[Completeness of registration and reliability of data highly variable. For evaluation of completeness of registration of livebirths and deaths see Tables 8 and 28; for stillbirth definitions, see discussion, page 27.]

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[1] Data include live-born infants dying before registration of birth.
[2] Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.
[3] Bathurst (Colony) only.
[4] Compulsory registration areas, which include about one-tenth of the total population.
[5] "Non-Moroccan" population.
[6] Former mandated territory (Union of South Africa).
[7] Data include live-born infants dying within 24 hours of birth.
[8] Prior to 1945, data are all foetal deaths reported, irrespective of period of gestation; beginning 1945, they exclude deaths of foetuses of less than 5 months' gestation.
[9] Civilian population.
[10] Excluding Yukon and Northwest Territories and, prior to 1950, Newfoundland, which became the tenth province on 1 April 1949. Data include stillbirths among Canadian residents temporarily in the United States; exclude stillbirths among US residents temporarily in Canada.

22. Nombre de mort-nés (morts foetales tardives) : 1938–1953

[Degré d'enregistrement et qualité des données très variables. Voir tableaux 8 et 28 pour des précisions sur le degré d'enregistrement des naissances vivantes et des décès; voir également les définitions relatives aux mort-nés à la page 71.]

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[1] Les données comprennent les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[2] L'enregistrement des naissances est facultatif; il n'est considéré comme complet que pour la population non indigène représentant une proportion relativement faible de la population totale.

[3] Bathurst (Colonie) seulement.

[4] Naissances signalées dans les régions où l'enregistrement est obligatoire et qui comprennent un dixième environ de la population totale.

[5] Population "non marocaine".

[6] Territoire auparavant sous mandat (Union Sud-Africaine).

[7] Les données comprennent les enfants nés vivants décédés dans les 24 heures.

[8] Avant 1945, les données se rapportent à toutes les morts foetales déclarées, indépendamment de la période de gestation. Depuis 1945, elles ne comprennent pas les décès de foetus de moins de 5 mois.

[9] Population civile.

[10] Non compris le Yukon, les Territoires du Nord-Ouest et, avant 1950, Terre-Neuve qui constitue la 10ème province du dominion depuis le 1er avril 1949. Les données comprennent les mort-nés parmi les Canadiens résidant provisoirement aux Etats-Unis; elles ne comprennent pas les mort-nés parmi les résidents américains temporairement au Canada.

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[1] Data include live-born infants dying before registration of birth.
[7] Data include live-born infants dying within 24 hours of birth.
[8] Prior to 1945, data are all foetal deaths reported, irrespective of period of gestation; beginning 1945, they exclude deaths of foetuses of less than 5 months' gestation.
[11] Coverage improved in recent years.
[12] For Curaçao, Aruba and Bonaire only.
[13] Excluding tribal Indian population, and also data for Canal Zone shown separately above.
[14] Prior to 1942, data are all foetal deaths reported, irrespective of period of gestation; beginning 1942, they exclude deaths of foetuses of less than 5 months' gestation.
[15] Prior to 1948, data include live-born infants dying within 24 hours of birth. Compulsory civil registration initiated in 1940.
[16] Beginning 1952, excluding aborigines, who comprise about one-tenth of the population.
[17] Statistics based on burial permits.
[18] Excluding Galápagos Islands and Provinces of Napo Pastaza and Santiago Zamora.
[19] Excluding Indian jungle population, estimated at 350 000.
[20] Excluding Negro and Indian population of the interior, estimated at 11 000 in 1921 and 25 700 in 1947.
[21] Excluding Indian jungle population, estimated at 56 700 in 1950.

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[1] Les données comprennent les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[7] Les données comprennent les enfants nés vivants décédés dans les 24 heures.

[8] Avant 1945, les données se rapportent à toutes les morts foetales déclarées, indépendamment de la période de gestation. Depuis 1945, elles ne comprennent pas les décès de foetus de moins de 5 mois.

[11] Portée des données améliorée les dernières années.

[12] Pour Curaçao, Aruba et Bonaire seulement.

[13] Non compris les indiens groupés en tribus et, également, la Zone du Canal qui figure séparément ci-dessus.

[14] Avant 1942, les données se rapportent à toutes les morts foetales déclarées indépendamment de la période de gestation. Depuis 1942, elles ne comprennent pas les décès de foetus de moins de 5 mois.

[15] Avant 1948, les données comprennent les enfants nés vivants décédés dans les 24 heures. L'enregistrement obligatoire est entré en vigueur en 1940.

[16] Depuis 1952, non compris les aborigènes qui représentent un dixième environ de la population totale.

[17] Statistiques établies d'après les permis d'inhumer.

[18] Non compris les îles Galápagos et les provinces de Napo Pastaza et de Santiago Zamora.

[19] Non compris la population indienne de la jungle estimée à 350 000 personnes.

[20] Non compris la population nègre et indienne de l'intérieur estimée à 11 000 personnes en 1921 et à 25 700 en 1947.

[21] Non compris la population indienne de la jungle estimée à 56 700 personnes en 1950.

22. Number of stillbirths (late foetal deaths) (continued)

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[2] Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.

[22] Colony only.

[23] Certain towns only, numbering 60 in 1951 and 1953, and 62 in 1952, and having a population of approximately 1.3 million.

[24] Selected ("Proclaimed") urban areas in which the registrar is a medical practitioner.

[25] Excluding tribal aborigines.

[26] Prior to 1947, registration area of former British Provinces, representing approximately 75 per cent of former India, not including Burma. 1946: excluding Northwest Frontier Provinces. Beginning 1947, registration area of Republic of India.

[27] Excludes stillbirths in State of Coorg.

[28] Excludes stillbirths in States of Coorg, Assam and Madhya Pradesh.

[29] Prior to 1948, including Netherlands New Guinea.

[30] Prior to 1948, Jewish population of Palestine.

[31] Japanese nationals in Japan only. Data are deaths of foetuses of at least 3 months' gestation. Increases in registered data beginning 1947 attributable to legalization of induced termination of pregnancy.

[32] Settled Moslem population of territory formerly under British mandate. For stillbirths among Jewish population, see Israel above.

[33] Prior to 1951, Singapore Island only.

[34] Excludes stillbirths in the 41 communes not under Belgian administration.

[35] Prior to 1941, excluding Southern Dobruja.

[36] Fluctuations 1940–1945 are attributable to conditions during the war.

[37] Excludes stillbirths in Alderney and Sark.

[38] Prior to 1948, excluding territory ceded by Hungary in 1947.

22. Nombre de mort-nés (morts foetales tardives) (suite)

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[2] L'enregistrement des naissances est facultatif; il n'est considéré comme complet que pour la population non indigène représentant une proportion relativement faible de la population totale.

[22] Colonie seulement.

[23] Certaines villes seulement, s'élevant à 60 en 1951 et 1953, à 62 en 1952, avec une population de 1 300 000 habitants environ.

[24] Certaines régions urbaines particulières ("Proclaimed") dans lesquelles l'officier de l'état civil est un médecin.

[25] Non compris les tribus aborigènes.

[26] Avant 1947, territoire d'enregistrement des anciennes provinces britanniques, représentant approximativement 75 pour cent de l'Inde avant le partage, non compris la Birmanie. 1946: non compris les provinces frontalières du Nord-Ouest. Depuis 1947, territoire d'enregistrement de la République de l'Inde.

[27] Non compris les mort-nés dans l'état de Coorg.

[28] Non compris les mort-nés dans les états de Coorg, Assam et Madya Pradesh.

[29] Avant 1948, y compris la Nouvelle-Guinée néerlandaise.

[30] Avant 1948, population juive de Palestine.

[31] Nationaux japonais au Japon seulement. Les données se rapportent aux décès de foetus de 3 mois au moins. Augmentation des enregistrements depuis 1947 due à la promulgation d'une législation permettant l'interruption provoquée de la grossesse.

[32] Population musulmane du territoire auparavant sous mandat britannique à l'exclusion des nomades. Pour les mort-nés parmi la population juive, voir Israël ci-dessus.

[33] Avant 1951, l'île de Singapour exclusivement.

[34] Non compris les 41 communes non administrées par la Belgique.

[35] Avant 1941, non compris la Dobroudja méridionale.

[36] La fluctuation des taux entre 1940–1945 provient des conditions spéciales de la période de guerre.

[37] Non compris Sercq et Alderney.

[38] Avant 1948, non compris le territoire cédé par la Hongrie en 1947.

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[8] Prior to 1945, data are all foetal deaths reported, irrespective of period of gestation; beginning 1945, they exclude deaths of foetuses of less than 5 months' gestation.

[39] Excludes stillbirths among civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at the end of 1948.

[40] Prior to 1951, Finnish nationals in Finland only.

[41] 1939–1942 and 1945: excluding Departments of Bas-Rhin, Haut-Rhin and Moselle; 1943 and 1944, excluding Corsica also.

[42] Prior to 1947, territory of the Treaty of Versailles; January 1947-April 1949, present territory excluding the commune of Kirrberg.

[43] Territory of 1937.

[44] Beginning 1951, West Berlin only.

[45] Prior to 1948, excluding Dodecanese. Beginning 1949, data are estimates based on stillbirths reported in a varying number of the 5 968 communes, i.e., 3 215 in 1949, 3 581 in 1950, 4 865 in 1951, 5 245 in 1952, and 4 998 in 1953.

[46] Including territory ceded to Czechoslovakia in 1947.

[47] Prior to 1943, territory of 1924-1938.

[48] Prior to 1949, excluding villages of Elten and Tüddern. Data include stillbirths occurring outside country if one or both parents are listed in a Netherlands population register.

[49] Changing territory; for description, see Table 2.

[50] Beginnnig 1943, British-US Zone only.

[51] Prior to 1947, excluding territory ceded by Italy in 1947. Coverage for 1947 and 1948 is incomplete owing to post-war reorganization of Registrar's Service.

[52] Years ended 31 March.

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[8] Avant 1945, les données se rapportent à toutes les morts foetales déclarées, indépendamment de la période de gestation. Depuis 1945, elles ne comprennent pas les décès de foetus de moins de 5 mois.

[39] Non compris les mort-nés parmi les civils étrangers vivant au Danemark sans permis de séjour environ 200 000 en 1945 et 2 500 fin 1948.

[40] Avant 1951, nationaux finlandais en Finlande seulement.

[41] 1939–1942 et 1945: non compris le Bas-Rhin, le Haut-Rhin et la Moselle; 1943 et 1944, non compris le Bas-Rhin, le Haut-Rhin, la Moselle et la Corse.

[42] Avant 1947, territoire du traité de Versailles; janvier 1947–avril 1949, territoire actuel non compris la commune de Kirrberg.

[43] Territoire de 1937.

[44] Depuis 1951, Berlin-Ouest seulement.

[45] Avant 1948, non compris le Dodécanèse. Depuis 1949, les données sont des estimations reposant sur les mort-nés signalés dans un certain nombre des 5 968 communes: 3 215 en 1949, 3 581 en 1950, 4 865 en 1951, 5 245 en 1952 et 4 998 en 1953.

[46] Y compris le territoire cédé à la Tchécoslovaquie en 1947.

[47] Avant 1943, territoire de 1924–1938.

[48] Avant 1949, non compris les villages d'Elten et de Tüddern. Les données comprennent les mort-nés hors du pays si l'un des parents au moins est porté sur un registre néerlandais d'état civil.

[49] Territoire de l'époque, voir précisions au tableau 2.

[50] Depuis 1943, zone anglo-américaine seulement.

[51] Avant 1947, non compris le territoire cédé par l'Italie en 1947. Données incomplètes pour 1947 et 1948 à la suite de la réorganisation, après guerre, des services de l'état civil.

[52] Années terminées le 31 mars.

23. Stillbirth (late foetal death) ratios : 1938–1953

[Ratios are the number of stillbirths per 1 000 live births. Reliability of ratios highly variable, being affected by completeness of both stillbirths and live births. For evaluation of completeness of registration of live births and deaths, see Tables 8 and 28; for stillbirth definitions, see discussion, page 27.]

Continent and country	1938	1939	1940	1941	1942	1943	1944	1945

*Provisional.

**Ratios for some years in this series are computed on frequencies less than 50.

† Data known to be by year of registration rather than by year of occurrence.

[1] Ratios based on stillbirths including live-born infants dying before registration of birth but computed on live births excluding them.

[2] Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.

[3] Bathurst (Colony) only.

[4] Compulsory registration areas, which include about one-tenth of the total population.

[5] "Non-Moroccan" population.

[6] Former mandated territory (Union of South Africa).

[7] Ratios based on stillbirths including live-born infants dying within 24 hours of birth but computed on live births e cluding them.

23. Taux de mortinatalité : 1938–1953

[Les taux représentent le nombre de mort-nés (morts foetales tardives) pour 1 000 naissances vivantes. Comme les taux se trouvent affectés par la mesure dans laquelle est complet l'enregistrement des mort-nés d'une part, et celui des naissances vivantes d'autre part, ils sont de qualité très variable. Voir tableaux 8 et 28 pour les précisions sur le degré d'enregistrement des naissances vivantes et des décès; voir également les définitions relatives aux mort-nés à la page 71.]

* Provisoire.

** Les taux pour certaines années de cette série ont été calculés sur des effectifs inférieurs à 50.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[1] Les taux reposent sur les mort-nés, y compris les enfants nés vivants décédés avant l'enregistrement de leur naissance, mais ont été calculés d'après des naissances vivantes ne les comprenant pas.

[2] L'enregistrement des naissances est facultatif; il n'est considéré comme complet que pour la population non indigène représentant une proportion relativement faible de la population totale.

[3] Bathurst (Colonie) seulement.

[4] Naissances signalées dans les régions où l'enregistrement est obligatoire et qui comprennent un dixième environ de la population totale.

[5] Population "non marocaine".

[6] Territoire auparavant sous mandat (Union Sud-Africaine).

[7] Les taux reposent sur les mort-nés, y compris les enfants nés vivants décédés dans les 24 heures, mais ont été calculés d'après des naissances vivantes ne les comprenant pas.

* Provisional.

** Ratios for some years in this series are computed on frequencies less than 50.

† Data known to be by year of registration rather than by year of occurrence.

[1] Ratios based on stillbirths including live-born infants dying before registration of birth but computed on live births excluding them.

[7] Ratios based on stillbirths including live-born infants dying within 24 hours of birth but computed on live births excluding them.

[8] Prior to 1945, ratios based on all foetal deaths reported, irrespective of period of gestation; beginning 1945, they exclude deaths of foetuses of less than 5 months' gestation.

[9] Civilian population.

[10] Excluding Yukon and Northwest Territories and, prior to 1950, Newfoundland, which became the tenth province on 1 April 1949. Ratios include stillbirths and live births among Canadian residents temporarily in the United States; exclude stillbirths and live births among US residents temporarily in Canada.

[11] Ratios are computed on live births tabulated by date of occurrence. Coverage improved in recent years.

[12] For Curaçao, Aruba and Bonaire only.

[13] Excluding tribal Indian population, and also data for Canal Zone shown separately above.

[14] Computed on births estimated from a 50 per cent sample.

[15] Prior to 1942, ratios based on all foetal deaths reported, irrespective of period of gestation; beginning 1942, they exclude deaths of foetuses of less than 5 months' gestation.

23. Taux de mortinatalité (suite)

* Provisoire.

** Les taux pour certaines années de cette série ont été calculés sur des effectifs inférieurs à 50.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[1] Les taux reposent sur les mort-nés, y compris les enfants nés vivants décédés avant l'enregistrement de leur naissance, mais ont été calculés d'après des naissances vivantes ne les comprenant pas.

[7] Les taux reposent sur les mort-nés, y compris les enfants nés vivants décédés dans les 24 heures, mais ont été calculés d'après des naissances vivantes ne les comprenant pas.

[8] Avant 1945, les taux reposent sur toutes les morts foetales déclarées, indépendamment de la période de gestation. Depuis 1945, ils ne comprennent pas les décès de foetus de moins de 5 mois.

[9] Population civile.

[10] Non compris le Yukon, les Territoires du Nord-Ouest et, avant 1950, Terre-Neuve qui constitue la 10ème province du dominion depuis le 1er avril 1949. Les taux comprennent les mort-nés et naissances vivantes parmi les Canadiens résidant provisoirement aux Etats-Unis; ils ne comprennent pas les mort-nés et les naissances vivantes parmi les résidents américains temporairement au Canada.

[11] Les taux ont été calculés d'après des naissances vivantes réparties suivant la date de la naissance. Portée des données améliorée les dernières années.

[12] Pour Curaçao, Aruba et Bonaire seulement.

[13] Non compris les indiens groupés en tribus et, également, la Zone du Canal qui figure séparément ci-dessus.

[14] Calculés d'après des naissances estimées par sondage à 50 pour cent.

[15] Avant 1942, les taux reposent sur toutes les morts foetales déclarées, indépendamment de la période de gestation. Depuis 1942, ils ne comprennent pas les décès de foetus de moins de 5 mois.

23. Stillbirth (late foetal death) ratios (continued)

* Provisional.

** Ratios for some years in this series are computed on frequencies less than 50.

† Data known to be by year of registration rather than by year of occurrence.

[1] Ratios based on stillbirths including live-born infants dying before registration of birth but computed on live births excluding them.

[2] Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.

[7] Ratios based on stillbirths including live-born infants dying within 24 hours of birth but computed on live births excluding them.

[16] Ratios computed on live births excluding live-born infants dying before registration of birth.

[17] Prior to 1948, ratios based on stillbirths including live-born infants dying within 24 hours of birth but computed on live births excluding them. Compulsory civil registration initiated in 1940.

[18] Beginning 1952, excluding aborigines, who comprise about one-tenth of the total population.

[19] Ratios computed on live births registered within two years of occurrence.

[20] Statistics based on burial permits; ratios computed on number of baptisms recorded in church registers.

[21] Excluding Galápagos Islands and Provinces of Napo Pastaza and Santiago Zamora.

[22] Excluding Indian jungle population, estimated at 350 000.

[23] Excluding Negro and Indian population of the interior, estimated at 11 000 in 1921 and 25 700 in 1947.

[24] Excluding Indian jungle population, estimated at 56 700 in 1950.

[25] Colony only.

[26] Certain towns only, numbering 60 in 1951 and 1953, and 62 in 1952, and having a population of approximately 1.3 million.

[27] Selected ("Proclaimed") urban areas in which the registrar is a medical practitioner. Ratios not computed by the Statistical Office of the United Nations, and computed on births including stillbirths.

[28] Excluding tribal aborigines.

[29] Prior to 1947, registration area of former British Provinces, representing approximately 75 per cent of former India, not including Burma. Beginning 1947, registration area of Republic of India.

[30] Prior to 1948, including Netherlands New Guinea.

[31] Prior to 1948, Jewish population of Palestine.

[32] Japanese nationals in Japan only. Ratios based on deaths of foetuses of at least 3 months' gestation. Increases beginning 1948 attributable to legalization of induced termination of pregnancy.

[33] Settled Moslem population of territory formerly under British mandate. For ratios among Jewish population, see Israel above.

[34] Prior to 1951, Singapore Island only.

23. Taux de mortinatalité (suite)

* Provisoire.

** Les taux pour certaines années de cette série ont été calculés sur des effectifs inférieurs à 50.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[1] Les taux reposent sur les mort-nés, y compris les enfants nés vivants décédés avant l'enregistrement de leur naissance, mais ont été calculés d'après des naissances vivantes ne les comprenant pas.

[2] L'enregistrement des naissances est facultatif; il n'est considéré comme complet que pour la population non indigène représentant une proportion relativement faible de la population totale.

[7] Les taux reposent sur les mort-nés, y compris les enfants nés vivants décédés dans les 24 heures, mais ont été calculés d'après des naissances vivantes ne les comprenant pas.

[16] Taux calculés d'après des naissances vivantes ne comprenant pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[17] Avant 1948, taux reposant sur les mort-nés, y compris les enfants nés vivants décédés dans les 24 heures, mais calculés d'aprés des naissances vivantes ne les comprenant pas. L'enregistrement obligatoire est entré en vigueur en 1940.

[18] Depuis 1952, non compris les aborigènes qui représentent un dixième environ de la population totale.

[19] Taux calculés d'après les naissances vivantes enregistrées dans un délai de deux ans.

[20] Statistiques établies d'après les permis d'inhumer. Taux calculés d'après le nombre de baptêmes inscrits sur les registres de l'église.

[21] Non compris les îles Galápagos et les provinces de Napo Pastaza et de Santiago Zamora.

[22] Non compris la population indienne de la jungle estimée à 350 000 personnes.

[23] Non compris la population nègre et indienne de l'intérieur estimée à 11 000 personnes en 1921 et à 25 700 en 1947.

[24] Non compris la population indienne de la jungle estimée à 56 700 personnes en 1950.

[25] Colonie seulement.

[26] Certaines villes seulement, s'élevant à 60 en 1951 et 1953, à 62 en 1952, avec une population de 1 300 000 habitants environ.

[27] Certaines régions urbaines particulières ("Proclaimed") dans lesquelles l'officier de l'état civil est un médecin. Ces taux, établis à partir de naissances comprenant les mort-nés, n'ont pas été calculés par le Bureau de Statistique de l'Organisation des Nations Unies.

[28] Non compris les tribus aborigènes.

[29] Avant 1947, territoire d'enregistrement des anciennes provinces britanniques, représentant approximativement 75 pour cent de l'Inde avant le partage, non compris la Birmanie. Depuis 1947, territoire d'enregistrement de la République de l'Inde.

[30] Avant 1948, y compris la Nouvelle-Guinée néerlandaise.

[31] Avant 1948, population juive de Palestine.

[32] Nationaux japonais au Japon seulement. Taux reposant sur les décès de foetus de 3 mois au moins. Augmentation des taux depuis 1948 due à la promulgation d'une législation permettant l'interruption provoquée de la grossesse.

[33] Population musulmane du territoire auparavant sous mandat britannique, à l'exclusion des nomades. Pour les taux relatifs à la population juive, voir Israël, ci-dessus.

[34] Avant 1951, l'île de Singapour exclusivement.

* Provisional.

** Ratios for some years in this series are computed on frequencies less than 50.

† Data known to be by year of registration rather than by year of occurrence.

[35] Excludes data for the 41 communes not under Belgian administration.

[36] Prior to 1941, excluding Southern Dobruja.

[37] Ratios computed on births tabulated by date of occurrence.

[38] Fluctuations 1940–1945 are attributable to conditions during the war.

[39] Excludes data for Alderney and Sark.

[40] Prior to 1948, excluding territory ceded by Hungary in 1947.

[41] Excludes stillbirths and live births among civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at the end of 1948.

[42] Prior to 1951, Finnish nationals in Finland only.

[43] 1939–1942 and 1945: excluding Departments of Bas-Rhin, Haut-Rhin and Moselle; 1943 and 1944, excluding Corsica also.

[44] Prior to 1947, territory of the Treaty of Versailles; January 1947–April 1949, present territory excluding the commune of Kirrberg.

[45] Territory of 1937.

[46] Beginning 1951, West Berlin only.

[47] Prior to 1948, excluding Dodecanese. Beginning 1949, ratios based on stillbirths and live births which have been adjusted for incomplete geographic coverage; see Tables 8 and 22.

[48] Including territory ceded to Czechoslovakia in 1947.

[49] Prior to 1943, territory of 1924–1938.

[50] Prior to 1949, excluding villages of Elten and Tüddern. Ratios include stillbirths and live births occurring outside country if one or both parents are listed in a Netherlands population register.

[51] Changing territory; for description, see Table 2.

[52] Beginning 1943, British-US Zone only.

[53] Prior to 1947, excluding territory ceded by Italy in 1947. Coverage for 1947 and 1948 is incomplete owing to post-war reorganization of Registrar's Service.

23. Taux de mortinatalité (suite)

* Provisoire.

** Les taux pour certaines années de cette série ont été calculés sur des effectifs inférieurs à 50.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[35] Non compris les 41 communes qui n'étaient pas administrées par la Belgique.

[36] Avant 1941, non compris la Dobroudja méridionale.

[37] Taux calculés d'après des naissances réparties suivant la date de la naissance.

[38] La fluctuation des taux entre 1940–1945 provient des conditions spéciales de la période de guerre.

[39] Non compris Sercq et Alderney.

[40] Avant 1948, non compris le territoire cédé par la Hongrie en 1947.

[41] Non compris les mort-nés et naissances vivantes parmi les civils étrangers vivant au Danemark sans permis de séjour, environ 200 000 en 1945 et 2 500 en 1948.

[42] Avant 1951, nationaux finlandais en Finlande seulement.

[43] 1939–1942 et 1945: non compris le Bas-Rhin, le Haut-Rhin et la Moselle; 1943 et 1944, non compris le Bas-Rhin, le Haut-Rhin, la Moselle et la Corse.

[44] Avant 1947, territoire du traité de Versailles; janvier 1947–avril 1949, territoire actuel non compris la commune de Kirrberg.

[45] Territoire de 1937.

[46] Depuis 1951, Berlin-Ouest seulement.

[47] Avant 1948, non compris le Dodécanèse. Depuis 1949, les taux reposent sur des données ajustées pour tenir compte des lacunes géographiques de l'enregistrement (voir tableaux 8 et 22).

[48] Y compris le territoire cédé à la Tchécoslovaquie en 1947.

[49] Avant 1943, territoire de 1924–1938.

[50] Avant 1949, non compris les villages d'Elten et de Tüddern. Les taux comprennent les mort-nés et naissances vivantes hors du pays si l'un des parents au moins est porté sur en registre d'état civil néerlandais.

[51] Territoire de l'époque, voir précisions au tableau 2.

[52] Depuis 1943, zone anglo-américaine seulement.

[53] Avant 1947, non compris le territoire cédé par l'Italie en 1947. Données incomplètes pour 1947 et 1948 à la suite de la réorganisation, après guerre, des services de l'état civil.

23. Stillbirth (late foetal death) ratios (continued)

[See headnote on page 470.]

† Data known to be by year of registration rather than by year of occurrence.
[6] Data include live-born infants dying within 24 hours of birth.
[7] Data are deaths of foetuses of at least 5 months' gestation.
[14] Prior to 1945, data are all foetal deaths reported irrespective of period of gestation; beginning 1945, they exclude deaths of foetuses of less than 5 months' gestation.
[15] Statistics based on burial permits.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[6] Les données comprennent les enfants nés vivants décédés dans les 24 heures.
[7] Les données se rapportent aux décès de foetus de moins de 5 mois.
[14] Avant 1945, les données se rapportent à toutes les morts foetales déclarées indépendamment de la période de gestation. Depuis 1945, elles ne comprennent pas les décès de foetus de moins de 5 mois.
[15] Statistiques établies d'après les permis d'inhumer.

24. Stillbirths (late foetal deaths) by age of mother (continued)

Mort-nés (morts foetales tardives) selon l'âge de la mère (suite)

† Data known to be by year of registration rather than by year of occurrence.
[16] Data are confinements resulting in stillbirths.
[17] Jewish population of Palestine.
[18] Japanese nationals in Japan only. Prior to 1951, data are deaths of foetuses of at least 3 months' gestation. Increases 1947–1950 attributable to legalization of induced termination of pregnancy.
[19] Including Okinawa. Data exclude "recognized illegitimate" stillbirths.
[20] Reason for discrepancy between this and corresponding figure in Table 22 not ascertained.
[21] Bangkok and Thonburi municipalities only.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[16] Les données se rapportent aux accouchements d'enfants mort-nés.
[17] Population juive de Palestine.
[18] Nationaux japonais au Japon seulement. Avant 1951, les données se rapportent aux décès de foetus de 3 mois au moins. Augmentation des enregistrements pour 1947–1950 due à la promulgation d'une législation permettant l'interruption provoquée de la grossesse.
[19] Y compris Okinawa. Les données ne comprennent pas les mort-nés illégitimes "reconnus".
[20] L'origine de la disparité entre cette donnée et le chiffre correspondant du tableau 22 n'a pu être déterminée.
[21] Municipalités de Bangkok et Thonburi seulement.

24. Stillbirths (late foetal deaths) by age of mother (continued)

[1] Data include live-born infants dying before registration of birth.
[22] Excluding civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at the end of 1948.
[23] Prior to 1951, Finnish nationals in Finland only.
[24] Age of mother obtained by subtracting year of birth of mother from year of registration of foetal death.
[25] Excluding Departments of Bas-Rhin, Haut-Rhin and Moselle; 1943 and 1944, excluding Corsica also.

[1] Les données comprennent les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[22] Non compris les civils étrangers vivant au Danemark sans permis de séjour, environ 200 000 en 1945 et 2 500 fin 1948.
[23] Avant 1951, nationaux finlandais en Finlande seulement.
[24] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enregistrement de la mort foetale.
[25] Non compris le Bas-Rhin, le Haut-Rhin et la Moselle. En 1943 et 1944, non compris le Bas-Rhin, le Haut-Rhin, la Moselle et la Corse.

24. Stillbirths (late foetal deaths) by age of mother (continued)

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[1] Data include live-born infants dying before registration of birth.
[20] Reason for discrepancy between this and corresponding figure in Table 22 not ascertained.
[24] Age of mother obtained by subtracting year of birth of mother from year of registration of foetal death.
[26] Age of mother obtained by subtracting year of birth of mother from year of delivery of dead foetus.
[27] Prior to 1943, territory of 1924–1938.

* Provisoire.
† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[1] Les données comprennent les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[20] L'origine de la disparité entre cette donnée et le chiffre correspondant du tableau 22 n'a pu être déterminée.
[24] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enregistrement de la mort foetale.
[26] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'accouchement du foetus mort.
[27] Avant 1943, territoire de 1924–1938.

24. Stillbirths (late foetal deaths) by age of mother (continued)
Mort-nés (morts foetales tardives) selon l'âge de la mère (suite)

See headnote on page 480. — Voir note explicative à la page 480.]

[20] Reason for discrepancy between this and corresponding figure in Table 22 not ascertained.
[27] Prior to 1943, territory of 1924–1938.
[28] Prior to 1949, excluding villages of Elten and Tüddern. Data include stillbirths occurring outside country if one or both parents are listed in a Netherlands population register.

[20] L'origine de la disparité entre cette donnée et le chiffre correspondant du tableau 22 n'a pu être déterminée.
[27] Avant 1943, territoire de 1924–1938.
[28] Avant 1949, non compris les villages d'Elten et de Tüddern. Les données comprennent les mort-nés hors du pays si l'un des parents au moins est porté sur un registre d'état civil. néerlandais

† Data known to be by year of registration rather than by year of occurrence.

[14] Prior to 1945, data are all foetal deaths reported irrespective of period of gestation; beginning 1945, they exclude deaths of foetuses of less than 5 months' gestation.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.

[14] Avant 1945, les données se rapportent à toutes les morts foetales déclarées indépendamment de la période de gestation. Depuis 1945, elles ne comprennent pas les décès de foetus de moins de 5 mois.

24. Stillbirths (late foetal deaths) by age of mother (continued)
Mort-nés (morts foetales tardives) selon l'âge de la mère (suite)

† Data known to be by year of registration rather than by year of occurrence.
[16] Data are confinements resulting in stillbirths.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[16] Les données se rapportent aux accouchements d'enfants mort-nés.

25. Stillbirth (late foetal death) ratios specific for age of mother : 1936–1953

Taux de mortinatalité selon l'âge de la mère : 1936–1953

[Ratios are number of stillbirths per 1 000 live births in specified age group. Completeness of registration and reliability of data highly variable; for evaluation of completeness of registration of live births and deaths see Tables 8 and 28; for stillbirth definitions, see discussion, page 27.

Les taux représentent le nombre de mort-nés (morts foetales tardives) pour 1 000 naissances vivantes dans chaque groupe d'âge. Degré d'enregistrement et qualité des données très variables. Voir tableaux 8 et 28 pour des précisions sur le degré d'enregistrement des naissances vivantes et des décès; voir également à la page 71 les définitions relatives aux mort-nés.]

* Provisional.
** Ratios are computed on frequencies less than 50.
[4] Ratios based on deaths of foetuses of at least 5 months' gestation.
[9] Excluding tribal Indian population, and also data for Canal Zone shown separately above.
[10] Ratios computed on live births estimated from a 50 per cent sample.
[11] Prior to 1945, ratios based on all foetal deaths reported irrespective of period of gestation; beginning 1945, based on deaths of foetuses of at least 5 months' gestation.
[12] Ratios based on stillbirths including live-born infants dying within 24 hours of birth, but computed on live births excluding them.
[13] Ratios based on confinements resulting in stillbirths, computed on confinements resulting in live births.

* Provisoire.
** Taux calculés sur des effectifs inférieurs à 50.
[4] Taux reposant sur les décès de foetus de 5 mois au moins.
[9] Non compris les indiens groupés en tribus et, également la Zone du Canal qui figure séparément ci-dessus.
[10] Taux calculés d'après une estimation des naissances vivantes obtenue par sondage à 50 pour cent.
[11] Avant 1945, les taux reposent sur toutes les morts foetales déclarées, indépendamment de la période de gestation. Depuis 1945, ils ne comprennent pas les décès de foetus de moins de 5 mois.
[12] Les taux reposent sur les mort-nés, y compris les enfants nés vivants décédés dans les 24 heures, mais ont été calculés d'après des naissances vivantes ne les comprenant pas.
[13] Taux reposant sur les accouchements d'enfants mort-nés et calculés d'après les accouchements d'enfants nés vivants.

† Data known to be by year of registration rather than by year of occurrence.
[14] Jewish population of Palestine.
[15] Japanese nationals in Japan only. Prior to 1951, data are deaths of foetuses of at least 3 months' gestation. Increases beginning 1947–1950 attributable to legalization of induced termination of pregnancy.
[16] Including Okinawa. Ratios exclude "recognized illegitimate" stillbirths and live births.
[17] Excluding civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at the end of 1948.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[14] Population juive de Palestine.
[15] Nationaux japonais au Japon seulement. Avant 1951, les données se rapportent aux décès de foetus de 3 mois au moins. Augmentation des taux depuis 1947–1950 due à la promulgation d'une législation permettant l'interruption provoquée de la grossesse.
[16] Y compris Okinawa. Les taux ne comprennent pas les naissances d'enfants "illégitimes reconnus" nés vivants et mort-nés.
[17] Non compris les civils étrangers vivant au Danemark sans permis de séjour, environ 200 000 en 1945 et 2 500 fin 1948.

[1] Ratios based on stillbirths including live-born infants dying before registration of birth, but computed on live births excluding them.
[18] Prior to 1951, Finnish nationals in Finland only.
[19] Age of mother obtained by subtracting year of birth of mother from year of registration of birth or foetal death.
[20] Excluding Departments of Bas-Rhin, Haut-Rhin and Moselle; 1943 and 1944, excluding Corsica also.
[21] Age of mother obtained by subtracting year of birth of mother from year of birth of child or delivery of dead foetus.

[1] Les taux reposent sur les mort-nés, y compris les enfants nés vivants décédés avant l'enregistrement de leur naissance, mais ont été calculés d'après des naissances vivantes ne les comprenant pas.
[18] Avant 1951, nationaux finlandais en Finlande seulement.
[19] L'âge de la mère a été obtenu en déduisant son année de naissance de l'année d'enregistrement de la naissance de l'enfant ou de la mort foetale.
[20] Non compris le Bas-Rhin, le Haut-Rhin et la Moselle. En 1943 et 1944, non compris le Bas-Rhin, le Haut-Rhin, la Moselle et la Corse.
[21] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enfant ou de celle de l'accouchement du foetus mort.

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[22] Prior to 1943, territory of 1924–1938.
[23] Discrepancy between this and corresponding ratio in Table 23 due to unexplained difference in base data.

* Provisoire.
† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[22] Avant 1943, territoire de 1924–1938.
[23] La disparité entre ce chiffre et le taux correspondant du tableau 23 est attribuable à une différence inexpliquée dans les données de base.

[23] Discrepancy between this and corresponding ratio in Table 23 due to unexplained difference in base data.
[24] Prior to 1949, excluding villages of Elten and Tüddern. Ratios include stillbirths and live births occurring outside country if one or both parents are listed in a Netherlands population register.
[25] Ratios exclude illegitimate stillbirths and live births.
[26] Ratios computed on confinements resulting in live births or stillbirths.

[23] La disparité entre ce chiffre et le taux correspondant du tableau 23 est attribuable à une différence inexpliquée dans les données de base.
[24] Avant 1949, non compris les villages d'Elten et de Tüddern. Les taux comprennent les mort-nés et naissances vivantes hors du pays si l'un des parents au moins est porté sur un registre d'état civil néerlandais.
[25] Les taux ne comprennent pas les naissances vivantes et mort-nés illégitimes.
[26] Taux calculés d'après les accouchements d'enfants nés vivants ou mort-nés.

25. Stillbirth (late foetal death) ratios specific for age of mother (continued)
Taux de mortinatalité selon l'âge de la mère (suite)

1953	19.1	–	17.0	16.0	15.5	20.2	30.0	42.0	36.6

** Ratios are computed on frequencies less than 50.
† Data known to be by year of registration rather than by year of occurrence.
[11] Prior to 1945, ratios based on all foetal deaths reported irrespective of period of gestation; beginning 1945, based on deaths of foetuses of at least 5 months' gestation.
[13] Ratios based on confinements resulting in stillbirths, computed on confinements resulting in live births.
[28] Ratios based on confinements resulting in stillbirths.

** Taux calculés sur des effectifs inférieurs à 50.
† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[11] Avant 1945, les taux reposent sur toutes les morts foetales déclarées, indépendamment de la période de gestation. Depuis 1945, ils ne comprennent pas les décès de foetus de moins de 5 mois.
[13] Taux reposant sur les accouchements d'enfants mort-nés et calculés d'après les accouchements d'enfants nés vivants.
[28] Taux reposant sur les accouchements d'enfants mort-nés.

26. Number of stillbirths (late foetal deaths) by age of mother and total-birth order : latest available years

Mort-nés (morts foetales tardives) selon l'âge de la mère et le rang de naissance : dernières années disponibles

[Total-birth order is based on number of previous live births and stillbirths to the mother. Completeness of registration and reliability of data highly variable. For evaluation of completeness of registration of livebirths and deaths, see Tables 8 and 28; for stillbirth definitions, see discussion, page 27.—

Le rang de naissance est calculé d'après le nombre d'enfants déjà nés vivants ou mort-nés de la mère. Degré d'enregistrement et qualité des données très variables. Voir tableaux 8 et 28 pour des précisions sur le degré d'enregistrement des naissances vivantes et des décès; voir également à la page 71 les définitions relatives aux mort-nés.]

[1] Data exclude illegitimate stillbirths.
[2] Data include legitimate live-born infants dying before registration of birth.
[9] For legitimate stillbirths, birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage; for illegitimate stillbirths, based on previous illegitimate live births and stillbirths.
[10] Age of mother obtained by subtracting year of birth of mother from year of registration of foetal death.

[1] Les données ne comprennent pas les mort-nés illégitimes.
[2] Les données comprennent les enfants légitimes nés vivants décédés avant l'enregistrement de leur naissance.
[9] Pour les mort-nés légitimes, numéro d'ordre d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours. Pour les mort-nés illégitimes, numéro d'ordre d'après les naissances vivantes et mort-nés illégitimes antérieurs.
[10] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enregistrement de la mort foetale.

26. Stillbirths (late foetal deaths) by age of mother and total-birth order (continued)

Mort-nés (morts foetales tardives) selon l'âge de la mère et le rang de naissance (suite)

[1] Data exclude illegitimate stillbirths.
[2] Data include legitimate live-born infants dying before registration of birth.
[10] Age of mother obtained by subtracting year of birth of mother from year of registration of foetal death.
[11] Age of mother obtained by subtracting year of birth of mother from year of delivery of dead foetus.
[12] Birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage.

[1] Les données ne comprennent pas les mort-nés illégitimes.
[2] Les données comprennent les enfants légitimes nés vivants décédés avant l'enregistrement de leur naissance.
[10] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enregistrement de la mort foetale.
[11] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'accouchement du foetus mort.
[12] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.

26. Stillbirths (late foetal deaths) by age of mother and total-birth order (continued)

Mort-nés (morts foetales tardives) selon l'âge de la mère et le rang de naissance (suite)

† Data known to be by year of registration rather than by year of occurrence.
[4] Method of calculating birth order not ascertained.
[16] Data are confinements resulting in legitimate stillbirths.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année de la naissance.
[4] La méthode de calcul du rang de naissance n'a pu être déterminée.
[16] Les données se rapportent aux accouchements d'enfants légitimes mort-nés.

27. Stillbirth (late foetal death) ratios specific for age of mother and total-birth order : latest available year
Taux de mortinatalité selon l'âge de la mère et le rang de naissance : dernière année disponible

[Ratios are number of stillbirths in each birth order per 1 000 live births in specified age groups. Total birth order is based on number of previous live births and stillbirths to the mother. Completeness of registration and reliability of data highly variable; for evaluation of completeness of registration of live births and deaths see Tables 8 and 28; for stillbirth definitions, see discussion, page 27. — Les taux représentent le nombre de mort-nés (morts foetales tardives) de chaque rang pour 1 000 naissances vivantes dans chaque groupe d'âge. Le rang de naissance est calculé d'après le nombre d'enfants déjà nés vivants et mort-nés de la mère. Degré d'enregistrement et qualité des données très variables. Voir tableaux 8 et 28 pour des précisions sur le degré d'enregistrement des naissances vivantes et des décès; voir également à la page 71 les définitions relatives aux mort-nés.]

[1] Ratios exclude illegitimate stillbirths and live births.
[2] Ratios based on legitimate stillbirths including legitimate live-born infants dying before registration of birth, but computed on live births excluding them.
[3] "Non-Moroccan" population.
[4] Not computed because live-birth base is either non-existent or smaller than the number of stillbirths.
[5] Ratios based on deaths of foetuses of at least 5 months' gestation.

[1] Non compris les naissances vivantes et mort-nés illégitimes.
[2] Les taux reposent sur les mort-nés légitimes, y compris les enfants légitimes nés vivants décédés avant l'enregistrement de leur naissance, mais ont été calculés d'après des naissances vivantes ne les comprenant pas.
[3] Population "non marocaine".
[4] Taux non calculé parce que les naissances vivantes devant lui servir de base sont soit inexistantes, soit moins nombreuses que les mort-nés.
[5] Taux reposant sur les décès de foetus de 5 mois au moins.

27. Stillbirth (late foetal death) ratios specific for age of mother and total-birth order (continued)

Taux de mortinatalité selon l'âge de la mère et le rang de naissance (suite)

[1] Ratios exclude illegitimate stillbirths and live births.
[2] Ratios based on legitimate stillbirths including legitimate live-born infants dying before registration of birth, but computed on live births excluding them.
[9] Age of mother obtained by subtracting year of birth of mother from year of registration of child's birth or foetal death.
[10] Age of mother obtained by subtracting year of birth of mother from year of birth of child or delivery of dead foetus.
[11] Birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage.

[1] Non compris les naissances vivantes et mort-nés illégitimes.
[2] Les taux reposent sur les mort-nés légitimes, y compris les enfants légitimes nés vivants décédés avant l'enregistrement de leur naissance, mais ont été calculés d'après des naissances vivantes ne les comprenant pas.
[9] L'âge de la mère a été obtenu en déduisant son année de naissance de l'année d'enregistrement de la naissance de l'enfant ou de la mort foetale.
[10] L'âge de la mère a été obtenu en déduisant son année de naissance de celle de l'enfant ou de celle de l'accouchement du foetus mort.
[11] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.

[1] Ratios exclude illegitimate stillbirths and live births.
[4] Not computed because live-birth base is either non-existent or smaller than the number of stillbirths.
[11] Birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage.
[12] Birth order based on number of previous live births and stillbirths during existing marriage.
[13] Ratios include stillbirths and live births occurring outside country if one or both parents are listed in a Netherlands population register.

[1] Non compris les naissances vivantes et mort-nés illégitimes.
[4] Taux non calculé parce que les naissances vivantes devant lui servir de base sont soit inexistantes, soit moins nombreuses que les mort-nés.
[11] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.
[12] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs du mariage en cours.
[13] Les taux comprennent les mort-nés et naissances vivantes hors du pays si l'un des parents au moins est porté sur un registre d'état civil néerlandais.

[1] Ratios exclude illegitimate stillbirths and live births.
[4] Not computed because live-birth base is either non-existent or smaller than the number of stillbirths.
[11] Birth order based on number of previous legitimate and legitimized live births and stillbirths during existing marriage.
[12] Birth order based on number of previous live births and stillbirths during existing marriage.
[14] Ratios based on confinements resulting in single legitimate stillbirths and computed on confinements resulting in legitimate live births or stillbirths.

[1] Non compris les naissances vivantes et mort-nés illégitimes.
[4] Taux non calculé parce que les naissances vivantes devant lui servir de base sont soit inexistantes, soit moins nombreuses que les mort-nés.
[11] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs, légitimes et légitimés, du mariage en cours.
[12] Numéro d'ordre des naissances d'après le nombre de naissances vivantes et mort-nés antérieurs du mariage en cours.
[14] Taux reposant sur les accouchements simples d'enfants légitimes mort-nés mais calculés d'après les accouchements d'enfants légitimes nés vivants ou mort-nés.

27. Stillbirth (late foetal death) ratios specific for age of mother and total-birth order (continued)

Taux de mortinatalité selon l'âge de la mère et le rang de naissance (suite)

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

[2] Data exclude deaths of infants dying before registration of birth.

[3] Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.

[4] European, Indian and Coloured, together comprising about one per cent of the total population.

[5] Estimated rate for total population was 24.8 according to recent surveys.

[6] For 1922–24.

[7] Unusually high values are attributable to drought and epidemics.

[8] Bathurst (Colony) only.

[9] Compulsory registration areas, which include about one-tenth of the total population.

[10] Reliability of rates affected by movements of population to and from the areas where registration is compulsory.

[11] For 1931–34.

[12] "Non-Moroccan" population. Rates computed on population excluding personnel in military establishments.

[13] Lagos only.

[14] Estimated rate for the indigenous population was 28.8 according to sample census of 1950.

[15] For 1938–39.

[16] Registration system for African population introduced in 1947.

[17] Estimated rate for the indigenous population was 19.8 in 1949.

[18] For 1936–39.

[19] Freetown and the rest of the Colony only.

[20] Estimated rate for the indigenous population was 18.1 according to sample census of 1948.

[21] Former mandated territory (Union of South Africa).

[22] Data exclude deaths of infants dying within 24 hours of birth.

28. Décès, 1946 – 1953, et taux bruts de mortalité, 1920 – 1939 et 1946 – 1953

[Les taux représentent le nombre de décès pour 1000 habitants. Les données ne comprennent pas les mort-nés. Voir explications page 75.]

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du décès.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrement irréguliers.

[2] Les données ne comprennent pas les décès de nouveau-nés survenus avant l'enregistrement de leur naissance.

[3] Enregistrement facultatif; considéré comme complet seulement pour la population non indigène représentant une proportion relativement faible de la population totale.

[4] Européens, indiens et métis représentant ensemble 1 pour cent environ de la population totale.

[5] Des enquêtes récentes on permis d'estimer à 24,8 pour 1 000 le taux se rapportant à la population totale.

[6] Pour 1922–24.

[7] Chiffres exceptionnellement élevés attribuables à la sécheresse et aux épidémies.

[8] Bathurst (Colonie) seulement.

[9] Taux reposant sur les naissances signalées dans les régions où l'enregistrement est obligatoire et qui comprennent un dixième environ de la population totale.

[10] La qualité des taux est altérée par des mouvements de population en provenance et en direction des territoires où l'enregistrement est obligatoire.

[11] Pour 1931–34.

[12] Population "non marocaine". La population à partir de laquelle les taux ont été calculés ne comprend pas les militaires dans les casernes.

[13] Lagos seulement.

[14] Le recensement par sondage de 1950 a permis d'estimer à 28,8 pour 1 000 le taux se rapportant à la population indigène.

[15] Pour 1938–39.

[16] Un système d'enregistrement pour la population africaine est entré en vigueur en 1947.

[17] Le taux se rapportant à la population indigène a été estimé à 19,8 pour 1 000 en 1949.

[18] Pour 1936–39.

[19] Freetown et le reste de la Colonie seulement.

[20] Le recensement par sondage de 1948 a permis d'estimer à 18,1 pour 1 000 le taux se rapportant à la population indigène.

[21] Territoire auparavant sous mandat (Union Sud-Africaine).

[22] Les données ne comprennent pas les décès de nouveau-nés survenus dans les 24 heures.

28. Deaths and crude death rates (continued)

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

[6] For 1922–24.

[11] For 1931–34.

[18] For 1936–39.

[22] Data exclude deaths of infants dying within 24 hours of birth.

[23] Registration among Moslem population very incomplete.

[24] For 1932–34.

[25] Civilian population only.

[26] For 1921–24.

[27] Excluding Yukon and Northwest Territories and, prior to 1950, Newfoundland which became the tenth province on 1 April 1949. Data include deaths of Canadian residents temporarily in the United States; exclude deaths of US residents temporarily in Canada.

[28] Coverage improved in recent years.

[29] Data include stillbirths.

[30] Prior to 1939, data exclude deaths of infants dying before registration of birth.

[31] For 1926–29.

[32] For 1930–32.

[33] For 1938.

[34] Coverage notably incomplete in earlier years.

[35] For Curaçao, Aruba and Bonaire only.

[36] For 1933–34.

[37] Excluding tribal Indian population, and also data for Canal Zone shown separately above.

[38] Prior to 1933, death-registration states only; by 1932 these states included 95 per cent of the total population.

[39] For 1922–23.

[40] For 1925 and 1927–29.

28. Décès et taux bruts de mortalité (suite)

* Provisoire.
† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du décès.
[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrement irréguliers.
[6] Pour 1922–24.
[11] Pour 1931–34.
[18] Pour 1936–39.
[22] Les données ne comprennent pas les décès de nouveau-nés survenus dans les 24 heures.
[23] Enregistrement très incomplet pour la population musulmane.
[24] Pour 1932–34.
[25] Population civile seulement.
[26] Pour 1921–24.
[27] Non compris le Yukon, les Territoires du Nord-Ouest et, avant 1950, Terre-Neuve qui constitue la 10ème province du dominion depuis le 1er avril 1949. Les données comprennent les décès de Canadiens résidant provisoirement aux Etats-Unis; elles ne comprennent pas les décès de résidents américains temporairement au Canada.
[28] Portée des données améliorée les dernières années.
[29] Les données comprennent les mort-nés.
[30] Avant 1939, les données ne comprennent pas les décès de nouveau-nés survenus avant l'enregistrement de leur naissance.
[31] Pour 1926–29.
[32] Pour 1930–32.
[33] Pour 1938.
[34] Données très incomplètes pour les premières années.
[35] Pour Curaçao, Aruba et Bonaire seulement.
[36] Pour 1933–34.
[37] Non compris les indiens groupés en tribus et, également, la Zone du Canal qui figure séparément ci-dessus.
[38] Avant 1933, états pratiquant l'enregistrement des décès seulement. En 1932, ces états comprenaient 95 pour cent de la population totale.
[39] Pour 1922–23.
[40] Pour 1925 et 1927–29.

28. Deaths and crude death rates (continued)

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".
[2] Data exclude deaths of infants dying before registration of birth.
[6] For 1922–24.
[15] For 1938–39.
[22] Data exclude deaths of infants dying within 24 hours of birth.
[24] For 1932–34.
[26] For 1921–24.
[29] Data include stillbirths.
[34] Coverage notably incomplete in earlier years.
[41] Prior to 1948, data exclude deaths of infants dying within 24 hours of birth.
[42] Compulsory civil registration initiated in 1940.
[43] For 1937–39.
[44] Beginning 1948, excluding aborigines, who comprise about one-tenth of the total population and for whom data are unreliable.
[45] Statistics based on burial permits.
[46] Excluding deaths in Galápagos Islands and Provinces of Napo Pastaza and Santiago Zamora, but rates computed on the total population.
[47] Excluding Indian jungle population, estimated at 350 000.
[48] Excluding Negro and Indian population of the interior, estimated at 11 000 in 1921 and 25 700 in 1947.
[49] Excluding Indian jungle population estimated at 56 700 in 1950.
[50] Colony only.
[51] Prior to 1940, registration area only, representing 82.5 per cent of total population at 1931 census. Beginning 1947, certain towns only, numbering 60 in 1951 and 1953, and 62 in 1952, and having a population of approximately 1.3 million.
[52] Excluding tribal aborigines. Beginning 1949, also excluding foreigners.
[53] Including Chandernagor, which became part of the Republic of India as of 2 May 1950.
[54] For 1939.
[55] Rates computed on civilian population.
[56] Prior to 1947, registration area of former British Provinces, representing approximately 75 per cent of former India, not including Burma. 1946: also excluding East Bengal. Beginning 1947, registration area of Republic of India.
[57] In Java and Madura only.
[58] Prior to 1949, years ended 21 March.
[59] Excluding Bedouin population in the Negev.
[60] Prior to 1948, Jewish population of Palestine.
[61] Excludes war casualties.
[62] Japanese nationals in Japan only.
[63] East Jordan only.
[64] Lebanese nationals only.

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du décès.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrement irréguliers.

[2] Les données ne comprennent pas les décès de nouveau-nés survenus avant l'enregistrement de leur naissance.

[6] Pour 1922–24.

[15] Pour 1938–39.

[22] Les données ne comprennent pas les décès de nouveau-nés survenus dans les 24 heures.

[24] Pour 1932–34.

[26] Pour 1921–24.

[29] Les données comprennent les mort-nés.

[34] Données très incomplètes pour les premières années.

[41] Avant 1948, les données ne comprennent pas les décès de nouveau-nés survenus dans les 24 heures.

[42] L'enregistrement obligatoire est entré en vigueur en 1940.

[43] Pour 1937–39.

[44] Depuis 1948, non compris les aborigènes qui représentent un dixième environ de la population totale et pour lesquels les données sont sujettes à caution.

[45] Statistiques établies d'après les permis d'inhumer.

[46] Les décès ne comprennent pas ceux survenus dans les îles Galápagos et les provinces de Napo Pastaza et Santiago Zamora bien que les taux aient été calculés d'après la population totale.

[47] Non compris la population indienne de la jungle estimée à 350 000 personnes.

[48] Non compris la population nègre et indienne de l'intérieur estimée à 11 000 personnes en 1921 et à 25 700 en 1947.

[49] Non compris la population indienne de la jungle estimée à 56 700 personnes en 1950.

[50] Colonie seulement.

[51] Avant 1940, territoire d'enregistrement seulement, comprenant 82,5 pour cent de la population totale au recensement de 1931. Depuis 1947, quelques villes seulement s'élevant à 60 en 1951 et 1953, à 62 en 1952, avec une population de 1 300 000 habitants environ.

[52] Non compris les tribus aborigènes. Depuis 1949, non compris également les étrangers.

[53] Y compris Chandernagor qui fait partie de la République de l'Inde depuis le 2 mai 1950.

[54] Pour 1939.

[55] Taux calculés d'après la population civile.

[56] Avant 1947, territoire d'enregistrement des anciennes provinces britanniques, représentant approximativement 75 pour cent de l'Inde avant le partage, non compris la Birmanie. 1946: non compris également la partie orientale du Bengale. Depuis 1947, territoire d'enregistrement de la République de l'Inde.

[57] Java et Madoura seulement.

[58] Avant 1949, années terminées le 21 mars.

[59] Non compris les bédouins du Negev.

[60] Avant 1948, population juive de Palestine.

[61] Non compris les pertes de guerre.

[62] Nationaux japonais au Japon seulement.

[63] Jordanie de l'Est seulement.

[64] Nationaux libanais seulement.

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

[2] Data exclude deaths of infants dying before registration of birth.

[3] Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.

[6] For 1922–24.

[15] For 1938–39.

[24] For 1932–34.

[26] For 1921–24.

[29] Data include stillbirths.

[31] For 1926–29.

[55] Rates computed on civilian population.

[65] Prior to 1941, territory of former British Malaya, i.e., including Singapore.

[66] Registration area only, representing about 90 per cent of total population.

[67] Settled Moslem population of territory formerly under British Mandate. For deaths and death rates among Jewish population, see Israel above.

[68] Present territory, i.e., excluding Amami Islands, which reverted to Japan 25 December 1953.

[69] Includes data for Amami Islands.

[70] Registration has improved under Registration Ordinance, operative since 1949, and is now believed to be 80 per cent complete.

[71] Prior to 1947, Singapore Island only.

[72] Excluding nomad and semi-nomad population, estimated at 288 400 in 1945.

[73] Including armed forces.

[74] Prior to 1941, excluding Southern Dobruja.

[75] Excludes data for Alderney and Sark.

[76] Prior to 1948, excluding territory ceded by Hungary in 1947.

[77] Excludes data for civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at the end of 1948.

[78] Prior to 1951, Finnish nationals in Finland only.

[79] For 1939 excludes data for Departments of Bas-Rhin, Haut-Rhin and Moselle.

[80] Prior to 1947, territory of the Treaty of Versailles. January 1947-April 1949, present territory, excluding the commune of Kirrberg.

[81] Territory of 1937.

[82] Beginning 1951, West Berlin only.

[83] Prior to 1948, excluding Dodecanese. Beginning 1949, data are estimates based on deaths reported in a varying number of the 5 968 communes, i.e., 3 215 in 1949, 3 581 in 1950, 4 865 in 1951, 5 245 in 1952 and 4 998 in 1953.

[84] For 1928–29.

[85] Prior to 1948, including territory ceded to Czechoslovakia in 1947.

[86] Prior to 1943, territory of 1924–1938.

28. Décès et taux bruts de mortalité (suite)

* Provisoire.

†Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du décès.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrement irréguliers.

[2] Les données ne comprennent pas les décès de nouveau-nés survenus avant l'enregistrement de leur naissance.

[3] Enregistrement facultatif; considéré comme complet seulement pour la population non indigène représentant une proportion relativement faible de la population totale.

[6] Pour 1922–24.

[15] Pour 1938–39.

[24] Pour 1932–34.

[26] Pour 1921–24.

[29] Les données comprennent les mort-nés.

[31] Pour 1926–29.

[55] Taux calculés d'après la population civile.

[65] Avant 1941, territoire de l'ancienne Malaisie britannique, c'est-à-dire, y compris Singapour.

[66] Territoire d'enregistrement seulement, comprenant environ 90 pour cent de la population totale.

[67] Population musulmane du territoire auparavant sous mandat britannique, à l'exclusion des nomades. Pour les décès et taux de mortalité parmi la population juive, voir Israël ci-dessus.

[68] Territoire actuel, c'est-à-dire, non compris les îles Amami rendues au Japon le 25 décembre 1953.

[69] Y compris les îles Amami.

[70] L'enregistrement s'est amélioré depuis l'entrée en vigueur de l'Ordonnance d'Enregistrement en 1949 et est à présent considéré comme complet dans une proportion de 80 pour cent.

[71] Avant 1947, l'île de Singapour exclusivement.

[72] Non compris les nomades et semi-nomades estimés à 288 400 en 1945.

[73] Y compris les forces armées.

[74] Avant 1941, non compris la Dobroudja méridionale.

[75] Non compris Alderney et Sercq.

[76] Avant 1948, non compris le territoire cédé par la Hongrie en 1947.

[77] Non compris les décès parmi les civils étrangers vivant au Danemark sans permis de séjour, environ 200 000 en 1945 et 2 500 fin 1948.

[78] Avant 1951, nationaux finlandais en Finlande seulement.

[79] Pour 1939, les données ne comprennent pas le Bas-Rhin, le Haut-Rhin et la Moselle.

[80] Avant 1947, territoire du traité de Versailles; janvier 1947-avril 1949, territoire actuel non compris la commune de Kirrberg.

[81] Territoire de 1937.

[82] Depuis 1951, Berlin-Ouest seulement.

[83] Avant 1948, non compris le Dodécanèse. Depuis 1949, les données sont des estimations reposant sur les décès signalés dans un certain nombre des 5 968 communes: 3 215 en 1949, 3 581 en 1950, 4 865 en 1951, 5 245 en 1952 et 4 998 en 1953.

[84] Pour 1928–29.

[85] Avant 1948, y compris le territoire cédé à la Tchécoslovaquie en 1947.

[86] Avant 1943, territoire de 1924–1938.

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

[6] For 1922–24.

[11] For 1931–34.

[18] For 1936–39.

[22] Data exclude deaths of infants dying within 24 hours of birth.

[26] For 1921–24.

[36] For 1933–34.

[87] Prior to 1949, excluding villages of Elten and Tüddern. Data include deaths of persons outside country if listed in a Netherlands population register.

[88] Data include deaths of Norwegian residents temporarily abroad.

[89] Prior to 1947, territory of 1923–1937.

[90] Data less reliable before 1950.

[91] For 1935–38.

[92] Changing territory; for description see Table 2.

[93] Beginning 1943, British-US Zone only.

[94] Data exclude deaths among armed forces outside country. 1946–1947: civilian population. 1948–1949: rates computed on population including armed forces outside country. Prior to 1939, deaths in England and Wales by year of registration.

[95] Prior to 1947, excluding territory ceded by Italy in 1947.

[96] Coverage for 1947 and 1948 is incomplete owing to post-war reorganization of Registrar's Service.

[97] Excluding full-blooded aborigines, estimated at 47 000 in 1944. Including armed forces outside country.

[98] Years ended 31 March.

[99] Prior to 1949, data include stillbirths.

[100] For 1935–37.

[101] Rates computed on population excluding military and administrative personnel and their dependents.

[102] Years ended 30 June.

[103] For 1936–37.

[104] Data include stillbirths among Samoan population. 1938–1950: years ended 31 March.

[105] For Samoan population only.

[106] For 1923–24.

28. Décès et taux bruts de mortalité (suite)

[Voir note explicative à la page 517.]

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du décès.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrement irréguliers.

[6] Pour 1922–24.

[11] Pour 1931–34.

[18] Pour 1936–39.

[22] Les données ne comprennent pas les décès de nouveau-nés survenus dans les 24 heures.

[26] Pour 1921–24.

[36] Pour 1933–34.

[87] Avant 1949, non compris les villages d'Elten et Tüddern. Les données comprennent les décès survenus à l'étranger si le défunt figurait sur un registre d'état-civil néerlandais.

[88] Les données comprennent les décès de Norvégiens résidant temporairement à l'étranger.

[89] Avant 1947, territoire de 1923–1937.

[90] Données moins complètes avant 1950.

[91] Pour 1935–38.

[92] Territoire de l'époque, voir précisions au tableau 2.

[93] A partir de 1943, zone anglo-américaine seulement.

[94] Non compris les décès parmi les forces armées hors du pays. 1946–1947: population civile. 1948–49: taux calculés d'après un chiffre de population comprenant les forces armées hors du pays. Avant 1939, les décès en Angleterre et au Pays de Galles se rapportent à l'année de l'enregistrement.

[95] Avant 1947, non compris le territoire cédé par l'Italie en 1947.

[96] Données incomplètes pour 1947 et 1948 à la suite de la réorganisation, après guerre, des services de l'état civil.

[97] Non compris les purs aborigènes, estimés à 47 000 en 1944. Y compris les forces armées hors du pays.

[9] Années terminées le 31 mars.

[99] Avant 1949, les taux comprennent les mort-nés.

[100] Pour 1935–37.

[101] Taux calculés d'après un chiffre de population ne comprenant pas les militaires et les fonctionnaires ainsi que les personnes à leur charge.

[102] Années terminées le 30 juin.

[103] Pour 1936–37.

[104] Les taux comprennent les mort-nés parmi les Samoans. 1938–1950: années terminées le 31 mars.

[105] Samoans exclusivement.

[106] Pour 1923–24.

29. Death rates specific for age and sex : 1946–1953

[Deaths of persons of specified age and sex per 1 000 population of the same age and sex. Data exclude stillbirths. For evaluation of quality of data, see Table 28 and discussion, page 31.]

† Data known to be by year of registration rather than by year of occurrence.
[1] Including deaths of persons of unknown age.
[14] Prior to 1948, Jewish population of Palestine.
[15] Rates exclude deaths due to war and, in 1948, are computed on population registered 8 November which reflected heavy immigration May-November.
[16] Rates exclude 244 deaths not tabulated by age and sex.
[17] Japanese nationals in Japan only.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du décès.

[1] Y compris les décès de personnes d'âge inconnu.

[14] Avant 1948, population juive de Palestine.

[15] Les taux ne comprennent pas les pertes de guerre et ont été calculés en 1948 d'après la population au 8 novembre qui reflétait la forte immigration des mois de mai à novembre.

[16] Les taux ne comprennent pas 244 décès non répartis selon l'âge et le sexe.

[17] Nationaux japonais au Japon seulement.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du décès.

[1] Y compris les décès de personnes d'âge inconnu.

[18] Y compris les îles Amami rendues au Japon le 25 décembre 1953.

[19] Pour une année terminée le 30 juin. Les taux comprennent les mort-nés.

[20] Taux reposant sur les décès enregistrés dans l'île de Singapour seulement mais calculés d'après la population totale.

† Data known to be by year of registration rather than by year of occurrence.

[1] Including deaths of persons of unknown age.

[27] Rates exclude deaths among armed forces outside country and, in 1946 and 1947, those among US armed forces stationed in the area. Prior to 1950, population base includes armed forces outside country.

[28] Excluding full-blooded aborigines, estimated at 47 000 in 1944. For 1946, rates exclude deaths among armed forces. Beginning 1947, rates include deaths among armed forces outside country.

[29] Differs from corresponding rate in Table 28 because computed on population estimate not revised in accordance with 1947 census results.

¶ For additional data, classified according to 1948 Revision, see Part B, beginning on page 568.

[1] Non-indigenous population.

[2] Data exclude deaths of infants dying within 24 hours of birth.

[3] Civilian population only.

[4] Reason for discrepancy between these data and corresponding figure shown in Tables 28 and 29 not ascertained.

30. Décès selon la cause: nombres et taux pour les dernières années disponibles, 1945–1953
Partie A: Décès classés selon la Nomenclature internationale abrégée de la révision de 1938 ¶

[Les taux représentent le nombre de décès pour 100 000 habitants. Les mort-nés ne sont pas compris. On a publié les nombres de décès et les taux de mortalité relatifs à d'autres années que la dernière lorsque ceux-ci n'ont pas encore figuré dans l'Annuaire. Voir explications à la page 76.]

¶ Des données complémentaires classées selon la révision de 1948 se trouvent à la partie B, page 568 et suivantes.

[1] Population non indigène.

[2] Les données ne comprennent pas les décès de nouveau-nés survenus dans les 24 heures.

[3] Population civile seulement.

[4] L'origine de la disparité entre ces données et les chiffres correspondants des tableaux 28 et 29 n'a pu être déterminée.

30. Deaths and death rates by cause (continued)

¶¶ Des données complémentaires classées selon la révision de 1938 se trouvent à la partie A, page 558 et suivantes.

[12] Les données comprennent les décès de Norvégiens résidant temporairement à l'étranger.

[23] Les données comprennent les décès survenus à l'étranger si le défunt figurait sur un registre d'état civil néerlandais.

[24] Zone anglo-américaine seulement.

[25] Les décès parmi les forces armées hors du pays sont exclus bien que celles-ci soient comprises dans le chiffre de population utilisé pour le calcul des taux.

¶¶ Des données complémentaires classées selon la révision de 1938 se trouvent à la partie A, page 558 et suivantes.

[25] Les décès parmi les forces armées hors du pays sont exclus bien que celles-ci soient comprises dans le chiffre de population utilisé pour le calcul des taux.

[26] Zone d'enregistrement seulement, comprenant 21,5 pour cent de la population totale.

[27] Non compris les purs aborigènes estimés à 47 000 en 1944. Y compris les forces armées hors du pays.

31. Infant deaths, 1946 – 1953, and infant mortality rates, 1920 – 1939 and 1946 – 1953

[Rates are the number of deaths of infants under 1 year of age per 1,000 live births. Data exclude stillbirths. For discussion, see page 33.]

*Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".
[2] Data exclude live-born infants dying before registration of birth.
[3] For 1922–24.
[4] European, Indian and Coloured, together comprising about one per cent of the total population.
[5] Infant deaths include stillbirths, but rates are computed on live births.
[6] Bathurst (Colony) only.
[7] Compulsory registration areas, which include about one-tenth of the total population.
[8] Reliability of data affected by movements of population to and from the areas where registration is compulsory.
[9] Rate not computed by the Statistical Office of the United Nations.
[10] For 1931–34.
[11] "Non-Moroccan" population.
[12] Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.
[13] Lagos only.
[14] For 1938–39.
[15] Freetown and the rest of the Colony only.
[16] Former mandated territory (Union of South Africa).
[17] Data exclude live-born infants dying within 24 hours of birth.
[18] Registration among Moslem population very incomplete.

31. Décès d'enfants de moins d'un an, 1946 – 1953 et taux de mortalité infantile, 1920 – 1939 et 1946 – 1953

[Les taux représentent le nombre de décès d'enfants âgés de moins d'un an pour 1 000 naissances vivants. Les données ne comprennent pas les mort-nés. Voir explications à la page 77.]

*Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du décès.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

[2] Les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[3] Pour 1922–24.

[4] Européens, indiens et métis représentant ensemble 1 pour cent environ de la population totale.

[5] Les décès d'enfants de moins d'un an comprennent les mort-nés, mais les taux ont été calculés d'après les naissances vivantes.

[6] Bathurst (Colonie) seulement.

[7] Taux reposant sur les naissances signalées dans les régions où l'enregistrement est obligatoire et qui comprennent un dixième environ de la population totale.

[8] La qualité des taux est altérée par des mouvements de population en provenance et en direction des territoires où l'enregistrement est obligatoire.

[9] Ce taux n'a pas été calculé par le Bureau de Statistique de l'Organisation des Nations Unies.

[10] Pour 1931–34.

[11] Population "non marocaine".

[12] Enregistrement facultatif; considéré comme complet seulement pour la population non indigène représentant une proportion relativement faible de la population totale.

[13] Lagos seulement.

[14] Pour 1938–39.

[15] Freetown et le reste de la Colonie seulement.

[16] Territoire auparavant sous mandat (Union Sud-Africaine).

[17] Les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

[18] Enregistrement très incomplet pour la population musulmane.

31. Infant deaths and infant mortality rates (continued)

[See headnote on page 588.]

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".
[3] For 1922–24.
[14] For 1938–39.
[17] Data exclude live-born infants dying within 24 hours of birth.
[19] For civilian population.
[20] For 1932–34.
[21] Excluding Yukon and Northwest Territories, and prior to 1950, Newfoundland, which became the tenth province on 1 April 1949. Data include events among Canadian residents temporarily in the United States; exclude events among US residents temporarily in Canada.
[22] For 1935–38.
[23] Rates are computed on live births tabulated by date of occurrence.
[24] For 1936–39.
[25] For 1920–23.
[26] Data include stillbirths.
[27] Prior to 1939, data exclude live-born infants dying before registration of birth.
[28] Rates computed on births which have been adjusted for underregistration as follows: 1930–1939, 3 per cent; 1940–1949, 2 per cent; 1950, 1.5 per cent.
[29] For 1926–29.
[30] For 1933–34.
[31] For 1927–29.
[32] For 1921–24.
[33] For 1925–27, 1929.
[34] For 1930–32.
[35] Coverage notably incomplete in earlier years.
[36] For Curaçao, Aruba and Bonaire only.
[37] Excluding tribal Indians, and also data for Canal Zone shown separately above.
[38] Computed on births estimated from a 50 per cent sample.
[39] Prior to 1933, birth and death registration states only; by 1932, these states included 95 per cent of the total population.

31. Décès d'enfants de moins d'un an et taux de mortalité infantile (suite)

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du décès.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U'" figure en regard des données considérées comme incomplètes ou issues denregistrements irréguliers.

[3] Pour 1922–24.

[14] Pour 1938–39.

[17] Les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

[19] Population civile seulement.

[20] Pour 1932–34.

[21] Non compris le Yukon, les Territoires du Nord-Ouest et, avant 1950, Terre-Neuve qui constitue la 10ème province du Dominion depuis le 1er avril 1949. Les données comprennent les décès d'enfants de moins d'un an parmi les Canadiens résident provisoirement aux Etats-Unis; elles ne comprennent pas ceux survenus parmi les résidents américains temporairement au Canada.

[22] Pour 1935–38.

[23] Les taux ont été calculés d'après des données (naissances vivantes) qui se rapportent à la date de la naissance.

[24] Pour 1936–39.

[25] Pour 1920–23.

[26] Les données comprennent les mort-nés.

[27] Avant 1939, les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[28] Taux calculés sur des données (naissances vivantes)ajustées dans la proportion suivante pour compenser les lacunes de l'enregistrement: 1930–39, 3 pour cent; 1940–1949, 2 pour cent; 1950, 1,5 pour cent.

[29] Pour 1926–29.

[30] Pour 1933–34.

[31] Pour 1927–29.

[32] Pour 1921–24.

[33] Pour 1925–27, 1929.

[34] Pour 1930–32.

[35] Données très incomplètes pour les premières années.

[36] Pour Curaçao, Aruba et Bonaire seulement.

[37] Non compris les indiens groupés en tribus ainsi que la Zone du Canal qui figure séparément ci-dessus.

[38] Calculé d'après les naissances estimées sur la base d'un sondage à 50 pour cent.

[39] Avant 1933, états pratiquant l'enregistrement des naissances et des décès seulement. En 1932, ces états comprenaient 95 pour cent de la population totale.

31. Infant deaths and infant mortality rates (continued)

[See headnote on page 588.]

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".
[2] Data exclude live-born infants dying before registration of birth.
[3] For 1922–24.
[10] For 1931–34.
[17] Data exclude live-born infants dying within 24 hours of birth.
[20] For 1932–34.
[32] For 1921–24.
[35] Coverage notably incomplete in earlier years.
[40] Rates computed on live births excluding infants dying before registration of birth.
[41] For 1938–1939, excludes data for Province of Santa Fé.
[42] Prior to 1948, data exclude live-born infants dying within 24 hours of birth.
[43] Compulsory civil registration initiated in 1940.
[44] For 1937–39.
[45] Beginning 1948, excluding aborigines, who comprise about one-tenth of the total population and for whom data are unreliable.
[46] Rates computed on live births registered within 2 years of occurrence.
[47] Statistics based on burial permits; rates computed on number of baptisms recorded in church registers.
[48] Excluding Galápagos Islands and Provinces of Napo Pastaza and Santiago Zamora.
[49] Excluding Indian jungle population, estimated at 350 000.
[50] Excluding Negro and Indian population of the interior, estimated at 11 000 in 1921 and 25 700 in 1947.
[51] Excluding Indian jungle population, estimated at 56 700 in 1950.
[52] Colony only.
[53] Prior to 1940, registration area only, representing 82.5 per cent of total population at 1931 census. Beginning 1947, certain towns only, numbering 60 in 1951 and 1953, and 62 in 1952, and having a population of approximately 1.3 million.
[54] Excluding tribal aborigines. Beginning 1949, also excluding foreigners.
[55] Prior to 1947, registration area of former British Provinces, representing approximately 75 per cent of former India, not including Burma. 1946: also excluding East Bengal. Beginning 1947, registration area of Republic of India.
[56] Prior to 1948, including Netherlands New Guinea.
[57] Excluding Bedouin population in the Negev.
[58] Prior to 1948, Jewish population of Palestine.
[59] Japanese nationals in Japan only.
[60] Territory of former British Malaya, i.e., including Singapore.
[61] Registration area only, representing about 90 per cent of the total population.

31. Décès d'enfants de moins d'un an et taux de mortalité infantile (suite)

[Voir note explicative à la page 589.]

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du décès.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

[2] Les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[3] Pour 1922–24.

[10] Pour 1931–34.

[17] Les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

[20] Pour 1932–34.

[32] Pour 1921–24.

[35] Données très incomplètes pour les premières années.

[40] Taux calculés d'après des données (naissances vivantes) ne comprenant pas les enfants décédés avant l'enregistrement de leur naissance.

[41] Pour 1938–1939 les données ne comprennent pas la province de Santa-Fé.

[42] Avant 1948, les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

[43] L'enregistrement obligatoire est entré en vigueur en 1940.

[44] Pour 1937–39.

[45] Depuis 1948, non compris les aborigènes qui représentent un dixième environ de la population totale et pour lesquels les données sont sujettes à caution.

[46] Taux calculés d'après les naissances vivantes enregistrées dans un délai de deux ans.

[47] Statistiques établies d'après les permis d'inhumer. Les taux ont été calculés à partir des baptêmes inscrits sur les registres de l'église.

[48] Non compris les îles Galápagos et les provinces de Napo Pastaza et Santiago Zamora.

[49] Non compris la population indienne de la jungle estimée à 350 000 personnes.

[50] Non compris la population nègre et indienne de l'intérieur estimée à 11 000 personnes en 1921 et à 25 700 en 1947.

[51] Non compris la population indienne de la jungle estimée à 56 700 personnes en 1950.

[52] Colonie seulement.

[53] Avant 1940, territoire d'enregistrement seulement, comprenant 82,5 pour cent de la population totale au recensement de 1931. Depuis 1947, quelques villes seulement s'élevant à 60 en 1951 et 1953, à 62 en 1952, avec une population de 1 300 000 habitants environ.

[54] Non compris les tribus aborigènes. Depuis 1949, non compris également les étrangers.

[55] Avant 1947, territoire d'enregistrement des anciennes provinces britanniques, représentant approximativement 75 pour cent de l'Inde avant le partage, non compris la Birmanie. 1946: non compris également la partie orientale du Bengale. Depuis 1947, territoire d'enregistrement de la République de l'Inde.

[56] Avant 1948, y compris la Nouvelle-Guinée néerlandaise.

[57] Non compris les bédouins du Negev.

[58] Avant 1948, population juive de Palestine.

[59] Nationaux japonais au Japon seulement.

[60] Territoire de l'ancienne Malaisie britannique ,c'est-à-dire, y compris Singapour.

[61] Territoire d'enregistrement seulement, comprenant environ 90 pour cent de la population totale.

31. Infant deaths and infant mortality rates (continued)

[See headnote on page 588.]

* Provisional.
† Data known to be by year of registration rather than by year of occurrence.
[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".
[3] For 1922–24.
[9] Rate not computed by the Statistical Office of the United Nations.
[12] Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.
[32] For 1921–24.
[40] Rates computed on live births excluding infants dying before registration of birth.
[62] Settled Moslem population of territory formerly under British Mandate. For infant deaths and rates among Jewish population, see Israel above.
[63] Registration has improved under Registration Ordinance, operative since 1949.
[64] Prior to 1951, Singapore Island only.
[65] Excluding nomad and semi-nomad population, estimated at 288 400 in 1945.
[66] For 1928–29.
[67] For 1921–24. Excludes data for Cantons of Eupen, Malmedy and St. Vith.
[68] Prior o 1941, excluding Southern Dobruja.
[69] 1920–1924: excluding Jersey, Alderney and Sark. 1925–1948: excluding Jersey. 1953: excluding Alderney and Sark.
[70] Prior to 1948, excluding territory ceded by Hungary in 1947.
[71] Excludes data for civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at the end of 1948.
[72] Prior to 1951, Finnish nationals in Finland only.
[73] For 1939, excludes data for Departments of Bas-Rhin, Haut-Rhin and Moselle.
[74] Prior to 1947, territory of the Treaty of Versailles. January 1947–April 1949, present territory, excluding the commune of Kirrberg.
[75] Territory of 1937.
[76] Beginning 1951, West Berlin only.
[77] Prior to 1948, excluding Dodecanese. Beginning 1949, data are estimates based on infant deaths and births reported in a varying number of the 5 968 communes, i.e., 3 215 in 1949, 3 581 in 1950, 4 865 in 1951, 5 245 in 1952 and 4 998 in 1953.
[78] Prior to 1948, including territory ceded to Czechoslovakia in 1947.
[79] Rates computed on live births registered within one year of occurrence.
[80] Prior to 1946, territory of 1924–1938.

31. Décès d'enfants de moins d'un an et taux de mortalité infantile (suite)

[Voir note explicative à la page 589.]

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du décès.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

[3] Pour 1922–24.

[9] Ce taux n'a pas été calculé par le Bureau de Statistique de l'Organisation des Nations Unies.

[12] Enregistrement facultatif; considéré comme complet seulement pour la population non indigène représentant une proportion relativement faible de la population totale.

[32] Pour 1921–24.

[40] Taux calculés d'après des données (naissances vivantes) ne comprenant pas les enfants décédés avant l'enregistrement de leur naissance.

[62] Population musulmane du territoire auparavant sous mandat britannique, à l'exclusion des nomades. Pour les décès d'enfants de moins d'un an et les taux de mortalité infantile parmi la population juive, voir Israël ci-dessus.

[63] L'enregistrement s'est amélioré depuis l'entrée en vigueur de l'Ordonnance d'Enregistrement en 1949.

[64] Avant 1951, l'île de Singapour exclusivement.

[65] Non compris les nomades et semi-nomades estimés à 288 400 en 1945.

[66] Pour 1928–29.

[67] Pour 1921–24. Non compris les cantons d'Eupen, Malmedy et Saint-Vith.

[68] Avant 1941, non compris la Dobroudja méridionale.

[69] 1920–1924: Non compris Jersey, Alderney et Sercq. 1925–1948: Non compris Jersey. 1953: Non compris Alderney et Sercq.

[70] Avant 1948, non compris le territoire cédé par la Hongrie en 1947.

[71] Non compris les décès d'enfants de moins d'un an parmi les civils étrangers vivant au Danemark sans permis de séjour, environ 200 000 en 1945 et 2 500 fin 1948.

[72] Avant 1951, nationaux finlandais en Finlande seulement.

[73] Pour 1939, non compris le Bas-Rhin, le Haut-Rhin et la Moselle.

[74] Avant 1947, territoire du traité de Versailles; janvier 1947–avril 1949, territoire actuel non compris la commune de Kirrberg.

[75] Territoire de 1937.

[76] Depuis 1951, Berlin-Ouest seulement.

[77] Avant 1948, non compris le Dodécanèse. Depuis 1949, les données sont des estimations reposant sur les décès d'enfants de moins d'un an et les naissances signalés dans un certain nombre des 5 968 communes: 3 215 en 1949, 3 581 en 1950, 4 865 en 1951, 5 245 en 1952 et 4 998 en 1953.

[78] Avant 1948, y compris le territoire cédé à la Tchécoslovaquie en 1947.

[79] Taux calculés d'après les naissances vivantes enregistrées dans un délai d'un an.

[80] Avant 1946, territoire de 1924–1938.

31. Infant deaths and infant mortality rates (continued)

[22] For 1935–38.
[26] Data include stillbirths.
[31] For 1927–29.
[38] Computed on births estimated from a 50 per cent sample.
[81] Prior to 1949, excluding villages of Elten and Tüddern. Data include births and deaths of infants outside country if listed in a Netherlands population register.
[82] Data include infant deaths of Norwegian residents temporarily abroad.
[83] Prior to 1948, territory of 1923–1937.
[84] Data less reliable before 1950.
[85] Changing territory; for description, see Table 2.
[86] British-US Zone.
[87] Commune only.
[88] Prior to 1938, data by year of registration.
[89] Prior to 1947, excluding territory ceded by Italy in 1947.
[90] Excluding full-blooded aborigines, estimated at 47 000 in 1944.
[91] Years ended 31 March.
[92] For 1930–33.
[93] Prior to 1949, data include stillbirths.
[94] Year ended 30 June.
[95] Samoan population. For 1946, year ended 31 March.

31. Décès d'enfants de moins d'un an et taux de mortalité infantile (suite)

[Voir note explicative à la page 589.]

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du décès.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

[17] Les données ne comprennent pas les enfants nés vivants décédés dans les 24 heures.

[20] Pour 1932–34.

[22] Pour 1935–38.

[26] Les données comprennent les mort-nés.

[31] Pour 1927–29.

[38] Calculé d'après les naissances estimées sur la base d'un sondage à 50 pour cent.

[81] Avant 1949, non compris les villages d'Elten et Tüddern. Les données comprennent les naissances et décès d'enfants de moins d'un an survenus hors du pays s'ils ont été portés sur un registre d'état civil néerlandais.

[82] Les données comprennent les décès d'enfants de moins d'un an parmi les Norvégiens résidant temporairement à l'étranger.

[83] Avant 1948, territoire de 1923–1937.

[84] Données moins complètes avant 1950.

[85] Territoire de l'époque, voir précisions au tableau 2.

[86] Zone anglo-américaine.

[87] Commune seulement.

[88] Avant 1938, les données se rapportent à l'année de l'enregistrement.

[89] Avant 1947, non compris le territoire cédé par l'Italie en 1947.

[90] Non compris les purs aborigènes estimés à 47 000 en 1944.

[91] Années terminées le 31 mars.

[92] Pour 1930–33.

[93] Avant 1949, les taux comprennent les mort-nés.

[94] Années terminées le 30 juin.

[95] Samoans exclusivement. Pour 1946, année terminée le 31 mars.

32. Marriages, 1946 – 1953, and crude marriage rates, 1920 – 1939 and 1946 – 1953

[Rates are the number of civil or religious marriages per 1000 populaton. For discussion, see page 34.]

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

1 Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

3 Increases reflect the effect of social-security programme introduced after World War II participation in which required civil registration of marriages.

3 Prior to 1947, data are marriages recorded in church registers.

4 Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.

5 European, Indian and Coloured, together comprising about one per cent of the total population.

6 For 1922-24.

7 Data are civil marriages only.

8 For 1931-34.

9 "Non-Moroccan" population.

10 Registration system for African population introduced in 1947.

11 For 1936-39.

12 Former mandated territory (Union of South Africa).

13 Including Moroccan Jewish population.

14 Registration compulsory for French population only.

15 Data exclude marriages in which one partner only is European.

16 Data are Christian and Moslem marriages.

32. Mariages, 1946 – 1953, et taux bruts de nuptialité, 1920 – 1939 et 1946 – 1953

[Les taux représentent le nombre de mariages civils ou religieux pour 1000 habitants. Voir explications à la page 79.]

Rate — Taux

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du mariage.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

[2] Augmentations attribuables à l'application d'un programme de sécurité sociale après la Deuxième Guerre mondiale et qui s'expliquent par le fait que pour bénéficier des allocations familiales les mariages musulmans doivent être enregistrés à l'état civil.

[3] Avant 1947, les données se rapportent aux mariages inscrits sur les registres de l'église.

[4] L'enregistrement des mariages est facultatif; il n'est considéré comme complet que pour la population non-indigène représentant une proportion relativement faible de la population totale.

[5] Européens, Indiens et métis, représentant ensemble environ 1 pour cent de la population totale.

[6] Pour 1922-24.

[7] Données relatives aux mariages civils seulement.

[8] Pour 1931-34.

[9] Population "non-marocaine".

[10] Un système d'enregistrement pour la population africaine est entré en vigueur en 1947.

[11] Pour 1936-39.

[12] Territoire auparavant sous mandat (Union Sud-Africaine).

[13] Y compris les marocains israélites.

[14] L'enregistrement n'est obligatoire que pour les Français.

[15] Non compris les mariages dans lesquels un seul des conjoints est européen.

[16] Les données se rapportent aux mariages chrétiens et musulmans.

32. Marriages and marriage rates (continued)

[See headnote on page 598.]

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

[6] For 1922-24.

[7] Data are civil marriages only.

[8] For 1931-34. [11] 1936-39.

[17] Rates computed on civilian population.

[18] For 1927-29. [19] For 1921-24.

[20] Excluding Yukon and Northwest Territories and, prior to 1950, Newfoundland, which became the tenth province on 1 April 1949.

[21] Statistics based on marriage licenses issued.

[22] Coverage improved in recent years.

[23] Includes large number of consensual unions formalized in response to special legislation.

[24] 1926-1937: years ended 31 July. 1938-1950: years ended 30 June.

[25] For 1930-31, 1933-34.

[26] Data are civil marriages only. Religious marriages not permitted without proof that civil marriage has been performed.

[27] Coverage notably incomplete in earlier years.

[28] For Curaçao, Aruba and Bonaire only.

[29] For Curaçao only.

[30] For 1938-39.

[31] For 1933-34.

[32] Excluding tribal Indian population, and also data for Canal Zone shown separately above.

[33] Data are estimates based on number of marriages performed for some areas, and on number of licenses issued or similar information for other areas.

[34] For year ended 30 June.

[35] Compulsory civil registration initiated in 1940.

[36] For 1937-39.

[37] Beginning 1948, excluding aborigines, who comprise about one-tenth of the total population and for whom data are unreliable.

[38] Data are marriages recorded in church registers.

[39] Data exclude marriages in the Galápagos Islands and Provinces of Napo Pastaza and Santiago Zamora, but rates computed on total population.

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du mariage.

1 La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des irréguliers.

6 Pour 1922-24.

7 Données relatives aux mariages civils seulement.

8 Pour 1931-34.

11 Pour 1936-39.

17 Taux calculés d'après la population civile.

18 Pour 1927-29.

19 Pour 1921-24.

20 Non compris le Yukon, les Territoires du Nord-Ouest et, avant 1950, Terre-Neuve qui constitue la 10ème province du dominion depuis le 1er avril 1949.

21 Statistiques établies d'après les licences de mariage délivrées.

22 Portée améliorée les dernières années.

23 Comprend un grand nombre d'unions consensuelles régularisées à la suite de la promulgation d'une législation spéciale.

24 1926-1937: années terminées le 31 juillet. 1938-1950: années terminées le 30 juin.

25 Pour 1930-31, 1933-34.

26 Les données se rapportent aux mariages civils seulement. Les mariages religieux ne sont permis que si les conjoints peuvent établir qu'ils se sont d'abord mariés civilement.

27 Données très incomplètes pour les premières années.

28 Pour Courçao, Aruba et bonaire exclusivement.

29 Pour Curaçao seulement.

30 Pour 1938-39.

31 Pour 1933-34.

32 Non compris les indiens groupés en tribus et, également, la Zone du Canal qui figure séparément ci-dessus.

33 Les données sont des estimations basées sur les mariages enregistrés dans certaines régions, et sur les licences de mariage délivrées ou des renseignements du même ordre dans d'autres.

34 Pour l'année terminée le 30 juin.

35 L'enregistrement obligatoire est entré en vigueur en 1940.

36 Pour 1937-39.

37 Depuis 1948, non compris les aborigènes qui représentent un dixième environ de la population totale et pour lesquels les données sont sujettes à caution.

38 Les données se rapportent aux mariages inscrits sur les registres de l'église.

39 Non compris les mariages célébrés dans les Iles Galápagos et dans les provinces de Napo Pastaza et Santiago Zamora, bien que les taux aient été calculés d'après la population totale.

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

1 Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

4 Registration not compulsory; believed to be complete for the non-indigenous population only, which represents a relatively small proportion of the total.

11 For 1936-39.

19 For 1921-24.

27 Coverage notably incomplete in earlier years.

40 Excluding Indian jungle population, estimated at 350 000.

41 Excluding Indian Negro population of the interior, estimated at 11 000 in 1921 and 15 700 in 1947. 1920-1939: data are civil marriages only; beginning 1946, including Hindu and Moslem ritual marriages, recognized by law in 1940.

42 Excluding Indian jungle population, estimated at 56 700 in 1950.

43 Kandyan marriages are completely registered. Registration of Moslem and General marriages is fairly complete.

44 Excluding tribal aborigines. Beginning 1949, also excluding foreigners.

45 Prior to 1949, years ended 20 March.

46 Excluding Bedouin population in the Negev.

47 Prior to 1948, Jewish population of Palestine.

48 Japanese nationals in Japan only. Delay in registration is highly variable, but has tended to decrease in recent years.

49 Lebanese nationals only.

50 For 1936, 1938-39.

51 Prior to 1953, including Amami Islands, which reverted to Japan 25 December 1953.

52 Excluding nomad and semi-nomad population, estimated at 288 400 in 1945.

53 For year ended 31 March.

54 Provincial and District capitals only.

55 Prior to 1946, excluding Southern Dobruja.

56 Excludes data for Guernsey and dependencies.

57 Prior to 1948, excluding territory ceded by Hungary in 1947.

58 Data are marriages in which the bride was domiciled in Finland.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du mariage.

1 La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

4 L'enregistrement des mariages est facultatif; il n'est considéré comme complet que pour la population non-indigène représentant une proportion relativement faible de la population totale.

11 Pour 1936-39.

19 Pour 1921-24.

27 Données très incomplètes pour les premières années.

40 Non compris la population indienne de la jungle estimée à 350 000 personnes.

41 Non compris la population nègre et indienne de l'intérieur estimée à 11 000 personnes en 1921 et à 25 700 en 1947. 1920-1939: les données se rapportent aux mariages civils seulement; depuis 1946, elles comprennent les mariages "rituels" hindous et musulmans reconnus par la loi en 1940.

42 Non compris la population indienne de la jungle estimée à 56 700 personnes en 1950.

43 Les mariages kandyans sont intégralement enregistrés. L'enregistrement des mariages musulmans et civils et assez complet.

44 Non compris les tribus aborigènes. Depuis 1949, non compris également les étrangers.

45 Avant 1949, années terminées le 20 mars.

46 Non compris les bédouins du Negev.

47 Avant 1948, population juive de Palestine.

48 Nationaux japonais au Japon. Le retard dans l'enregistrement est très variable mais il a tendance à s'atténuer depuis quelques années.

49 Nationaux libanais seulement.

50 Pour 1936, 1938-39.

51 Avant 1953, y compris les Iles Amami rendues au Japon le 25 décembre 1953.

52 Non compris les nomades et semi-nomades estimés à 288 400 en 1945.

53 Pour l'année terminée le 31 mars.

54 Chefs-lieux de province et de district seulement.

55 Avant 1946, non compris la Dobroudja méridionale.

56 Non compris Guernesey et ses dépendances.

57 Avant 1948, non compris le territoire cédé par la Hongrie en 1947.

58 Les données se rapportent aux mariages pour lesquels l'épouse est domiciliée en Finlande.

* Provisional.

† Data known to be by year of registration rather than by year of occurrence.

[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities in registration or incomplete coverage are coded "U".

[6] For 1922-24.

[7] Data are civil marriages only.

[11] For 1936-39.

[17] Rates computed on civilian population.

[19] For 1921-24.

[59] Prior to 1947, territory of the Treaty of Versailles. January 1947-April 1949: present territory, excluding the commune of Kirrberg.

[60] Territory of 1937.

[61] Beginning 1951, West Berlin only.

[62] Prior to 1948, excluding Dodecanese. Beginning 1949, data are estimates based on marriages reported in a varying number of the 5 968 communes, i.e., 3 215 in 1949, 3 581 in 1950, 4 865 in 1951, 5 245 in 1952 and 4 998 in 1953.

[63] Prior to 1948, including territory ceded to Czechoslovakia in 1947.

[64] Prior to 1943, territory of 1924-1938. 1936-1950: rates computed on population including armed forces outside country and civilians following the troops.

[65] For 1932-34.

[66] Prior to 1949, excluding villages of Elten and Tüddern. Data include marriages occurring outside country if registered in a Netherlands population register within one year.

[67] Data are marriages in which the groom was domiciled in Norway.

[68] Prior to 1946, territory of 1923-1937.

[69] Data less reliable before 1950.

[70] For 1935-38.

[71] Changing territory; for description, see Table 2.

[72] Beginning 1946, British-US Zone only.

[73] 1946-1949: rates computed on population including armed forces outside country.

[74] Prior to 1947, excluding territory ceded by Italy in 1947.

[75] Coverage for 1947 and 1948 is incomplete owing to post-war reorganization of Registrar's Service.

[76] Excluding full-blooded aborigines, estimated at 47 000 in 1944.

[77] Prior to 1947 and for 1953, years ended 31 March.

[78] Rates computed on population excluding military and administrative personnel and their dependents.

* Provisoire.

† Données signalées comme relatives à l'année de l'enregistrement plutôt qu'à l'année du mariage.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

[6] Pour 1922-24.

[7] Données relatives aux mariages civils seulement.

[11] Pour 1936-39.

[17] Taux calculés d'après la population civile.

[19] Pour 1921-24.

[59] Avant 1947, territoire du traité de Versailles. Janvier 1947 à avril 1949, territoire actuel, non compris la commune de Kirrberg.

[60] Territoire de 1937.

[61] Depuis 1951, Berlin-Ouest exclusivement.

[62] Avant 1948, non compris le Dodécanèse. Depuis 1949, les données sont des estimations reposant sur les mariages signalés dans un certain nombre des 5 968 communes: 3 215 en 1949, 3 581 en 1950, 4 865 en 1951, 5 245 en 1952 et 4 998 en 1953.

[63] Avant 1948, y compris le territoire cédé à la Tchécoslovaquie en 1947.

[64] Avant 1943, territoire de 1924-1938. 1936-1950: taux calculés d'après un chiffre de population comprenant les forces armées hors du pays et les civils accompagnant les troupes.

[65] Pour 1932-34.

[66] Avant 1949, non compris Elten et Tüddern. Les données comprennent les mariages célébrés hors du pays lorsqu'ils sont transcrits sur un registre d'état civil néerlandais dans un délai d'un an.

[67] Les données se rapportent aux mariages pour lesquels l'époux est domicilié en Norvège.

[68] Avant 1946, territoire de 1923-1937.

[69] Données moins complètes avant 1950.

[70] Pour 1935-38.

[71] Territoire de l'époque, voir précisions au tableau 2.

[72] Depuis 1946, zone anglo-américaine seulement.

[73] 1946-1949: taux calculés d'après un chiffre de population comprenant les forces armées hors du pays.

[74] Avant 1947, non compris le territoire cédé par l'Italie en 1947.

[75] Données incomplètes pour 1947 et 1948 à la suite de la réorganisation, après guerre, des services de l'état civil.

[76] Non compris les purs aborigènes estimés à 47 000 en 1944.

[77] Avant 1947 et pour 1953, années terminées le 31 mars.

[78] Taux calculés d'après un chiffre de population ne comprenant pas les militaires et fonctionnaires ainsi que leurs familles.

* Provisional.

[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities or incomplete coverage are coded "U".

[2] "Civilized" population only, comprising about 3 per cent of the total.

[3] European, Indian and Coloured, together comprising about one per cent of the total population.

[4] Data include revocable divorces and annulments among Moslem population (about 95 per cent of total).

[5] "Non-Moroccan" population.

[6] Type and character of data not specified in source.

[7] Including Moroccan Jewish population.

[8] Data are Christian and Moslem divorces only, including annulments and separations.

[9] Data include annulments.

[10] Statistics based on petitions for divorce entered in courts.

[11] New divorce law was introduced during 1948.

[12] Rates computed on civilian population.

[13] Excluding Yukon and Northwest Territories and, prior to 1950, Newfoundland, which became the tenth province on 1 April 1949.

[14] 1946-1949: excluding Virgin Islands [UK].

[15] Excludes divorces in Saba, St. Eustatius and St. Martin.

34. Divorces, nombres et taux bruts: 1946 –1953

[Les taux représentent le nombre de divorces prononcés pour 1 000 habitants. Voir explications à la page 82.]

* Provisoire.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

[2] Population "civilisée" seulement, représentant environ 3 pour cent du total.

[3] Européens, Indiens et métis représentant ensemble 1 pour cent environ de la population totale.

[4] Les données comprennent les divorces révocables et les annulations parmi la population musulmane (environ 95 pour cent du total).

[5] Population "non marocaine".

[6] Type et nature des données non indiqués à la source.

[7] Y compris les marocains israélites.

[8] Les données se rapportent aux divorces entre chrétiens et entre musulmans seulement et comprennent les annulations et séparations.

[9] Les données comprennent les annulations.

[10] Statistiques établies d'après les instances en divorce devant les tribunaux.

[11] Une nouvelle loi régissant le divorce est entrée en vigueur en 1948.

[12] Taux calculés d'après la population civile.

[13] Non compris le Yukon, les Territoires du Nord-Ouest et, avant 1950, Terre-Neuve qui constitue la 10ème province du dominion depuis le 1er avril 1949.

[14] 1946-1949: non compris les îles Vierges [R-U].

[15] Non compris les divorces dans les îles de Saba, St.-Eustache et St.-Martin.

34. Divorces and divorce rates (continued)

* Provisional.

[1] Data stated to be complete or virtually complete are coded "C"; those stated to be affected by irregularities or incomplete coverage are coded "U".

[6] Type and character of data not specified in source.

[9] Data include annulments.

[16] Excluding tribal Indian population, and also data for Canal Zone shown separately above.

[17] Data are estimates based on divorces and annulments reported by a varying number of states.

[18] Data include annulments. High rates attributable to divorces of non-permanent residents.

[19] Excluding aborigines, who comprise about one-tenth of the population.

[20] Data exclude divorces in the Galápagos Islands and Provinces of Napo Pastaza and Santiago Zamora but rates computed on total population.

[21] Excluding Indian jungle population, estimated at 56 700 in 1950.

[22] Colony only.

[23] Excluding tribal aborigines. Beginning 1949, also excluding foreigners.

[24] Prior to 1949, years ended 21 March.

[25] Excluding Bedouin population in the Negev.

[26] Prior to 1948, Jewish population of Palestine.

[27] Japanese nationals in Japan only.

[28] Lebanese nationals only.

[29] Settled Moslem population of territory formerly under British mandate. For divorces among Jewish population, see Israel above.

[30] Prior to 1953, including Amami Islands which reverted to Japan 25 December 1953.

[31] Excluding nomad and semi-nomad population, estimated at 288 400 in 1945.

* Provisoire.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

[6] Type et nature des données non indiqués à la source.

[9] Les données comprennent les annulations.

[16] Non compris les indiens groupés en tribus et, également, la Zone du Canal qui figure séparément ci-dessus.

[17] Les données reposent sur une estimation des divorces et sur les annulations signalées dans un nombre variable d'états.

[18] Les données comprennent les annulations signalées. Les taux élevés sont attribuables aux divorces entre résidents non permanents.

[19] Non compris les aborigènes qui représentent un dixième environ de la population totale.

[20] Les données ne comprennent pas les divorces dans les îles Galápagos et dans les provinces de Napo Pastaza et Santiago Zamora, bien que les taux aient été calculés d'après la population totale.

[21] Non compris la population indienne de la jungle estimée à 56 700 personnes en 1950.

[22] Colonie seulement.

[23] Non compris les tribus aborigènes. Depuis 1949, non compris également les étrangers.

[24] Avant 1949, années terminées le 21 mars.

[25] Non compris les bédouins du Negev.

[26] Avant 1948, population juive de Palestine.

[27] Nationaux japonais au Japon seulement.

[28] Nationaux libanais seulement.

[29] Population musulmane du territoire auparavant sous mandat britannique, à l'exclusion des nomades. Pour les divorces parmi la population juive, voir Israël ci-dessus.

[30] Avant 1953, y compris les îles Amami rendues au Japon le 25 décembre 1953.

[31] Non compris les nomades et semi-nomades estimés à 288 400 en 1945.

34. Divorces and divorce rates (continued)

* Provisoire.

[1] La lettre "C" figure en regard des données considérées comme complètes ou pratiquement complètes; la lettre "U" figure en regard des données considérées comme incomplètes ou issues d'enregistrements irréguliers.

[6] Type et nature des données non indiqués à la source.

[9] Les données comprennent les annulations.

[10] Statistiques établies d'après les instances en divorce devant les tribunaux.

[12] Taux calculés d'après la population civile.

[32] Non compris le territoire cédé par la Hongrie en 1947.

[33] Depuis 1949, Berlin-Ouest seulement.

[34] Avant 1949, non compris les villages d'Elten et de Tüddern.

[35] Territoire de l'époque, voir précisions au tableau 2.

[36] Taux calculés d'après un chiffre de population comprenant les forces armées hors du pays.

[37] Avant 1950, taux calculés d'après un chiffre de population comprenant les forces armées hors du pays. Avant 1953, statistiques établies d'après less instances en divorce.

[38] Non compris les purs aborigènes estimés à 47 000 en 1944.

[39] 1951-1953: années terminées le 31 mars.

[40] Taux calculés d'après un chiffre de population ne comprenant pas les militaires et fonctionnaires ainsi que leurs familles.

[41] Avant 1949, non compris les Maoris.

[42] Années terminées le 30 juin.

[43] Avant 1951, années terminées le 31 mars.

35. Divorce rates per 1 000 married couples : 1935–1953

Taux de divorce pour 1 000 couples mariés : 1935–1953

[Rates are the annual average number of divorces in the period specified per 1 000 married couples. For evaluation of quality of data, see Table 34 and discussion, page 37.—

Les taux représentent le nombre annuel moyen de divorces pendant la période indiquée, pour 1 000 couples mariés. Voir tableau 34 et page 82 pour des précisions sur la qualité des données.]

* Provisional.
[1] Computed on population excluding personnel in military establishments.
[2] Rates include revocable divorces and annulments among Moslem population (about 95 per cent of total).
[3] Computed on population including persons consensually married.
[4] Rate based on divorces for one year only because of change in reporting system which took effect in 1947.
[5] Rates include annulments.
[6] Statistics based on petitions for divorce entered in courts.
[7] Excluding Yukon and Northwest Territories and, 1940–42, also excluding Newfoundland which became the tenth province on 1 April 1949.
[8] Rates based on an estimated number of divorces and annulments reported by a varying number of states.
[9] Excluding Indian jungle population, estimated at 56 700 in 1950.
[10] Japanese nationals in Japan only.

* Provisoire.
[1] Calculé d'après un chiffre de population ne comprenant pas les militaires comptés à part.
[2] Les taux comprennent les divorces révocables et les annulations parmi la population musulmane (environ 95 pour cent du total).
[3] Calculé d'après un chiffre de population comprenant les unions consensuelles.
[4] La source de transmission des données sur les divorces ayant changé en 1947, le taux a été calculé sur la base des divorces enregistrés au cours d'une année seulement.
[5] Les taux comprennent les annulations.
[6] Statistiques établies d'après les instances en divorce devant les tribunaux.
[7] Non compris le Yukon, les Territoires du Nord-Ouest et, pour 1940–42, également Terre-Neuve qui constitue la 10ème province du dominion depuis le 1er avril 1949.
[8] Les données reposent sur une estimation des divorces et sur les annulations signalées dans un nombre variable d'états.
[9] Non compris la population indienne de la jungle estimée à 56 700 personnes en 1950.
[10] Nationaux japonais au Japon seulement.

[2] Data relate to an area with 294 749 000 inhabitants at the census in 1951. Rates for ages under 5 and 60 and over are estimated.

[3] Rates for ages 75 and over are unreliable.

[4] Japanese nationals in Japan only.

[5] Rates exclude deaths among foreign nationals, but are computed on a population including them.

[2] Les données se rapportent à un territoire comprenant 294 749 000 personnes au recensement de 1951. Les quotients pour les âges inférieurs à 5 ans et ceux de 60 ans et plus sont des estimations.

[3] Les quotients de mortalité pour les âges de 75 ans et plus sont sujets à caution.

[4] Nationaux japonais au Japon seulement.

[5] Les quotients de mortalité ne s'appliquent pas aux étrangers bien qu'ils aient été calculés d'après une population les comprenant.

37. Survivors at specified ages for each sex: unpublished data

[Number of persons who would survive to the exact age specified, out of 100 000 born alive and subject to mortality conditions of period indicated. For discussion, see page 39.]

[2] Data relate to an area with 294 749 000 inhabitants at the census in 1951. Survivors out of 100 000 alive at age 5. Values for ages under 5 and 60 and over are estimated.

[3] Survivors out of 1 000 born alive. Values for ages 75 and over are unreliable.

[4] Japanese nationals in Japan only.

[5] Survivors out of 10 000 born alive.

[2] Les données se rapportent à un territoire comprenant 294 749 000 personnes au recensement de 1951. Survivants sur 100 000 enfants ayant atteint l'âge de 5 ans. Les valeurs relatives aux âges inférieurs à 5 ans et à ceux de 60 ans et plus sont des estimations.

[3] Survivants sur 1 000 nés vivants. Les valeurs relatives aux âges de 75 ans et plus sont sujettes à caution.

[4] Nationaux japonais au Japon seulement.

[5] Survivants sur 10 000 nés vivants.

38. Expectation of life at specified ages for each sex: unpublished data

[Average number of years of life remaining to persons surviving to exact age specified, if subject to mortality conditions of period indicated. For discussion, see page 39.]

[1] Travailleurs algériens musulmans allant en France métropolitaine et en revenant.

[2] Nationaux et étrangers, effectuant par mer des trajets intercontinentaux, exclusivement. Le total des sorties par tous moyens de transport s'éleva en 1952 à 337 896, en 1953 à 213 323; le total des entrées, en 1952 à 405 102, en 1953 à 242 874.

[3] Passagers étrangers de 1ère, 2ème et 3ème classe effectuant par mer des trajets intercontinentaux et déclarant s'en aller définitivement.

[4] Passagers étrangers de 1ère, 2ème et 3ème classe ayant effectué par mer des trajets intercontinentaux, entrant pour la première fois avec l'intention de s'établir, y compris les passagers entrés clandestinement puis autorisés à s'établir.

[5] Passagers de 1ère, 2ème et 3ème classe, effectuant par mer des trajets intercontinentaux, qui sont soit des nationaux soit des étrangers manifestant l'intention de revenir, quelle que soit la durée de séjour antérieur à leur départ.

[6] Passagers de 1ère, 2ème et 3ème classe, ayant effectué par mer des trajets intercontinentaux, qui sont soit des nationaux soit des étrangers anciens résidents; la durée probable du séjour est inconnue.

[7] Etrangers exclusivement.

[8] Voyageurs ayant résidé dans le pays pendant un an ou plus, le quittant pour un an ou plus.

[9] Voyageurs exprimant pour la première fois l'intention de résider dans le pays pour un an ou plus.

[10] Y compris les membres des forces armées australiennes et leurs familles, quelle que soit la durée de leur séjour à l'étranger.

[11] Nationaux exclusivement, non compris les personnes déplacées et apatrides, sauf mention contraire.

[12] Etrangers ayant reçu une autorisation de séjour prolongé.

[13] Pour affaires et pour prendre un emploi.

[14] Y compris 2 565 réfugiés dont la langue maternelle n'était pas l'allemand et 6 159 d'origine allemande.

[15] Y compris 1 644 réfugiés dont la langue maternelle n'était pas l'allemand et 58 d'origine allemande.

[16] Non compris les indigènes de ces territoires.

[17] Voyageurs munis d'un visa d'une durée de validité indéterminée.

[18] Nombre de cartes de frontaliers délivrées; erreur par défaut évaluée à moins de 2 pour cent.

[19] 54 915 cartes délivrées pour la France et 9 366 pour les Pays-Bas.

[20] 42 712 cartes délivrées pour la France et 7 572 pour les Pays-Bas.

[21] Emigrants.

[22] Immigrants.

39. Major categories of departures and arrivals (continued)

[See headnote on page 634.]

Temporary immigrants departing — Sorties d'immigrants temporaires				8 615	9 511	9 601

[23] Nationals only.
[24] Intercontinental travellers only.
[34] Excluding movements to and from East Berlin, Eastern Germany, the Eastern German territories under the administration of Poland or the USSR, and Western Germany.
[35] For 10 months, beginning 1 March.
[36] Aliens having stayed in licensed lodgings.
[37] Non-indigenous travellers only. Departures and arrivals of indigenous travellers by sea are unknown; by air, in 1949, departures numbered 1 479, arrivals 1 251.
[38] Nationals leaving by sea for employment abroad, and their dependents, except after short home visits.
[39] Nationals returning by sea via Bombay from employment abroad, and their dependents, except for short home visits.
[40] Non-Jewish travellers in April and May and a probably small number of Jewish travellers in May omitted.
[41] Persons indicating the intention to leave permanently.
[42] Included among Residents departing temporarily or returning after temporary sojourn abroad.
[43] Included among Visitors.
[44] Nationals going abroad to work or establish their residence.
[45] Departures of emigrants; arrivals of 764 immigrants and 2 972 non-immigrants.
[46] Data based on number of passports issued to nationals during years ending 31 March of following year; excluding service personnel and their families.
[47] The excess of arrivals over departures does not correspond to an actual immigration since all departures across the Algerian border are not counted.
[48] Excluding movements of visitors.

Temporary immigrants — Immigrants temporaires				1 549	3 664	1 883

[23] Nationaux exclusivement.
[24] Voyageurs intercontinentaux exclusivement.
[34] Non compris les mouvements avec Berlin-Est, l'Allemagne Orientale, les territoires allemands de l'Est sous l'administration de la Pologne ou de l'URSS et l'Allemagne occidentale.
[35] Pour 10 mois, commençant le 1er mars.
[36] Etrangers ayant habité dans des logements agréés.
[37] Non-indigènes exclusivement. Les nombres de voyageurs indigènes sortant et entrant par mer ne sont pas connus; par air les sorties s'élevènent pour 1949 à 1 479, et les entrées à 1 251.
[38] Nationaux sortant par mer pour s'embaucher à l'étranger, et leurs familles, sauf après de courts séjours dans les foyers.
[39] Nationaux arrivant par mer à Bombay en fin d'emploi à l'étranger, et leurs familles, sauf pour de courts séjours dans les foyers.
[40] Sont omis les voyageurs non-juifs en avril et mai, et les voyageurs juifs probablement peu nombreux en mai.
[41] Personnes déclarant s'en aller définitivement.
[42] Compris parmis les résidents s'en allant temporairement ou rentrant après un séjour temporaire à l'étranger.
[43] Compris parmis les visiteurs.
[44] Nationaux allant à l'étranger pour y travailler ou y établir leur résidence.
[45] Sorties d'émigrants; entrées de 764 immigrants et 2 972 non-immigrants.
[46] Données basées sur le nombre des passeports délivrés à des nationaux pendant des années se terminant le 31 mars de l'année suivante; non compris les membres des forces armées et leurs familles.
[47] L'excédent des entrées sur les sorties ne correspond pas à un mouvement réel d'immigration étant donné que toutes les sorties par la frontière algérienne ne sont pas comptées.
[48] Non compris les mouvements de visiteurs.

Notes to Table 40 (continued)

[43] Source V for 1952. Source II for 1953.
[44] Excluding departures to Berlin, Eastern Germany, Eastern German territories under the administration of Poland or the USSR, the Saar. Reason for discrepancy of 7 817 between this figure and that derived from Table 39 not ascertained.
[45] Data for North and South America, Unspecified, are aggregated.
[46] Includes data for North America, Unspecified.
[47] Data for Denmark and Iceland are aggregated.
[48] Data for Belgium and Luxembourg are aggregated.
[49] Data for Denmark, Finland, Iceland and Norway are aggregated.
[50] Data for Finland and Norway are aggregated.
[51] Supplementary data: to East Berlin 8 907, Eastern Germany 7 780, Eastern German territories under the administration of Poland or the USSR 87, Western Germany 32 617, Saar 151.
[52] Supplementary data: to East Berlin 7 780, Eastern Germany 5 807, Eastern German territories under the administration of Poland or the USSR 25, Western Germany 38 261, Saar 124.
[53] Supplementary data: to East Berlin 3 214, Eastern Germany 6 914, Eastern German territories under the administration of Poland or the USSR 24, Western Germany 60 782, Saar 149.
[54] Supplementary data: to East Berlin 3 283, Eastern Germany 7 898, Eastern German territories under the administration of Poland or the USSR 20, Western Germany 285 150, Saar 191.
[55] Reason for discrepancy between these and corresponding data in Table 39 is that continental emigrants are excluded here.
[56] Data for Europe and USSR are aggregated.
[57] Relates to Surinam.
[58] Relates to Cuba.
[59] Includes 2 594 for Cuba.
[60] Relates to Uruguay.
[61] Includes 5 233 for Uruguay.
[62] Data for Australia and New Zealand are aggregated.
[63] Reason for discrepancy between these and corresponding data in Table 39 is a difference in definition. Data given here relate to national and alien intercontinental emigrants reported by the Swiss emigration agencies.
[64] Includes 4 214 for British East Africa, 2 718 for British West Africa, 936 for Northern Rhodesia, 4 250 for Southern Rhodesia.
[65] Includes 3 156 for British East Africa, 3 106 for British West Africa, 1 280 for Northern Rhodesia, 5 496 for Southern Rhodesia.
[66] Includes 2 492 for British East Africa, 4 282 for British West Africa, 1 000 for Northern Rhodesia, 3 478 for Southern Rhodesia.
[67] Includes 1 674 for British West Indies in 1951, 1 866 in 1952, and 1 596 in 1953.
[68] Relates to Chile.
[69] Data for Ceylon, India and Pakistan are aggregated.
[70] Includes 220 for Singapore in 1951, 253 in 1952, and 291 in 1953.
[71] Includes 157 for Malta in 1951, 723 in 1952, and 386 in 1953.
[72] Includes 237 for Fiji Islands, 1 344 for New Guinea (Aust.).
[73] Includes 187 for Fiji Islands, 1 683 for New Guinea (Aust.), 1 248 for Papua.
[74] Includes 325 for Fiji Islands, 1 681 for New Guinea (Aust.), 862 for Papua.
[75] Includes 359 for Fiji Islands, 1 845 for New Guinea (Aust.), 938 for Papua.
[76] Years ended 31 March.
[77] Includes 273 for Fiji Islands in 1950/51, 353 in 1951/52, and 315 in 1952/53.

Notes du tableau 40 (suite)

[43] Source V pour 1952. Source II pour 1953.
[44] Non compris les sorties à destination de Berlin, de l'Allemagne Orientale, des Territoires allemands de l'Est sous l'administration de la Pologne ou de l'URSS et de la Sarre. La raison de la différence de 7 817 entre ce chiffre et celui qu'on peut déduire du tableau 39 n'a pu être déterminée.
[45] Les données pour les catégories Non spécifié relatives à l'Amérique du Nord et du Sud sont groupées.
[46] Y compris les données pour la catégorie Non spécifié relative à l'Amérique du Nord.
[47] Les données pour le Danemark et l'Islande sont groupées.
[48] Les données pour la Belgique et le Luxembourg sont groupées.
[49] Les données pour le Danemark, la Finlande, l'Islande et la Norvège sont groupées.
[50] Les données pour la Finlande et la Norvège sont groupées.
[51] Données supplémentaires: Berlin-Est 8 907, Allemagne Orientale 7 780, Territoires allemands de l'Est sous l'administration de la Pologne ou de l'URSS 87, Allemagne Occidentale 32 617, la Sarre 151.
[52] Données supplémentaires: Berlin-Est 7 780, l'Allemagne Orientale 5 807, Territoires allemands de l'Est sous l'administration de la Pologne ou de l'URSS 25, l'Allemagne Occidentale 38 261, la Sarre 124.
[53] Données supplémentaires: Berlin-Est 3 214, l'Allemagne Orientale 6 914, Territoires allemands de l'Est sous l'administration de la Pologne ou de l'URSS 24, l'Allemagne Occidentale 60 782, la Sarre 149.
[54] Données supplémentaires: Berlin-Est 3 283, l'Allemagne Orientale 7 898, Territoires allemands de l'Est sous l'administration de la Pologne ou de l'URSS 20, l'Allemagne Occidentale 285 150, la Sarre 191.
[55] La raison de la disparité entre ces données et celles qui leur correspondent dans le tableau 39 est que les émigrants continentaux ne sont pas compris ici.
[56] Les données pour l'Europe et l'URSS sont groupées.
[57] Se rapporte au Surinam.
[58] Se rapporte à Cuba.
[59] Y compris 2 594 pour Cuba.
[60] Se rapporte à l'Uruguay.
[61] Y compris 5 233 pour l'Uruguay.
[62] Les données pour l'Australie et la Nouvelle-Zélande sont groupées.
[63] La raison de la disparité entre ces données et celles qui leur correspondent dans le tableau 39 est une différence de définition. Les données du présent tableau se rapportent aux émigrants intercontinentaux, nationaux et étrangers, d'après les renseignements fournis par les agences suisses d'émigration.
[64] Y compris 4 214 pour l'Afrique-Orientale Britannique, 2 718 pour l'Afrique-Occidentale Britannique, 936 pour la Rhodésie du Nord, 4 250 pour la Rhodésie du Sud.
[65] Y compris 3 156 pour l'Afrique-Orientale Britannique, 3 106 pour l'Afrique-Occidentale Britannique, 1 280 pour la Rhodésie du Nord, 5 496 pour la Rhodésie du Sud.
[66] Y compris 2 492 pour l'Afrique-Orientale Britannique, 4 282 pour l'Afrique-Occidentale Britannique, 1 000 pour la Rhodésie du Nord, 3 478 pour la Rhodésie du Sud.
[67] Y compris 1 674 pour les Indes Occidentales Britanniques en 1951, 1 866 en 1952 et 1 596 en 1953.
[68] Se rapporte au Chili.
[69] Les données pour Ceylan, l'Inde et le Pakistan sont groupées.
[70] Y compris 220 pour Singapour en 1951, 253 en 1952 et 291 en 1953.
[71] Y compris 157 pour Malte en 1951, 723 en 1952 et 386 en 1953.
[72] Y compris 237 pour les îles Fidji et 1 344 pour la Nouvelle-Guinée (Aust.).
[73] Y compris 187 pour les îles Fidji, 1 683 pour la Nouvelle-Guinée (Aust.) et 1 248 pour Papua.
[74] Y compris 325 pour les îles Fidji, 1 681 pour la Nouvelle-Guinée (Aust.) et 862 pour Papua.
[75] Y compris 359 pour les îles Fidji, 1 845 pour la Nouvelle-Guinée (Aust.) et 938 pour Papua.
[76] Années finissant le 31 mars.
[77] Y compris 273 pour les îles Fidji en 1950/51, 353 en 1951/52 et 315 en 1952/53.

41. Immigrants by country of last permanent residence : 1950 – 1953
Immigrants par pays de la précédente résidence permanente : 1950 – 1953

[Data for 1947 – 1949, not previously available, are included for certain countries. For discussion, see page 45.—
Des données pour 1947 – 1949, précédemment non disponibles, sont présentées pour certains pays. Voir explications à la page 91.]

Voir notes et explications des chiffres romains à la page 664.

Notes to Table 41

(a) [Unless otherwise indicated, the grand total of immigrants or arriving travellers for any country of immigration may be readily identified in Table 39, and thus related to a major category of arrivals. For definition and other particulars of the major category, see Table 39.]

(b) [Roman numerals following country names indicate the source of data. (I) Port statistics; (II) statistics of frontier control; (III) statistics of registration coupons detached from certain documents; (IV) passport statistics; (V) statistics of local population registers; (VI) other statistics.]

* Provisional.
[1] Data classified by country of citizenship.
[2] Includes 295 for Syria and Lebanon in 1949, 300 in 1950.
[3] Includes 143 for Lebanon and Syria, 213 for Liberia.
[4] Includes 220 for Lebanon and Syria, 259 for Liberia.
[5] British nationals.
[6] Includes 48 for Kenya, 65 for Mozambique, 546 for Northern and Southern Rhodesia.
[7] Includes 121 for Northern Rhodesia, 324 for Southern Rhodesia.
[8] Includes 172 for Northern Rhodesia, 340 for Southern Rhodesia.
[9] Includes 365 for Northern Rhodesia, 694 for Southern Rhodesia.
[10] Data for Ceylon and India are aggregated.
[11] Includes 86 for Federation of Malaya in 1951, 141 in 1952, 48 in 1953.
[12] Data classified by country of departure.
[13] Includes 846 for Netherlands Antilles, 3 445 for British West Indies, 6 007 for other parts of the West Indies.
[14] Includes 794 for Netherlands Antilles, 4 409 for British West Indies, 7 397 for other parts of the West Indies.
[15] Includes 670 for Colombia, 3 448 for Cuba, 845 for Panama.
[16] Includes 1 036 for Colombia, 3 943 for Cuba, 954 for Panama.
[17] Data for Ireland (Rep.) and United Kingdom are aggregated.
[18] Reason for discrepancy between these and corresponding data in Table 39 is that only first-time immigrants are included here; differences therefore represent the numbers of former alien residents returning after a sojourn abroad of one year or more.
[19] Reason for discrepancy between these and corresponding data in Table 39 is a difference in definition. Data given here relate to alien 2nd and 3rd class passengers having travelled by sea over intercontinental routes.
[20] Includes 321 for Chile, 45 for Paraguay, 83 for Uruguay.
[21] Includes 1 120 for Chile, 59 for Paraguay, 122 for Uruguay.
[22] Includes 1 438 for Chile, 79 for Paraguay, 93 for Uruguay.
[23] Includes 371 for Lebanon, 334 for Syria, 253 for Turkey.
[24] Includes 274 for Lebanon, 196 for Syria, 176 for Turkey.
[25] Includes 167 for Lebanon, 118 for Syria, 85 for Turkey.
[26] In addition, fragmentary data are available for the following countries: Federation of Malaya, 1953 total 205 865, of which 40 316 Malays, 31 888 Chinese, 39 197 Indians and Pakistanis, 3 174 Europeans and Americans; Turkey, 1951 total 102 436, of which 102 208 from Bulgaria, 228 from the rest of Europe; 1952 total 630; 1953 total 2 998, of which 1 113 from Yugoslavia, 1 883 from the rest of Europe.
[27] Includes 31 for Hawaii.
[28] Includes 26 for Burma, 26 for Cambodia, 636 for Hong Kong, 43 for Korea, 71 for Macao, 84 for Federation of Malaya, 11 for North Borneo, 117 for Thailand, 125 for Vietnam.
[29] Includes 159 for Iran, 229 for Iraq, 294 for Jordan, 2 266 for Lebanon, 1 491 for Turkey.
[30] Includes 53 for Iran, 202 for Iraq, 334 for Jordan, 7 976 for Lebanon, 3 124 for Turkey.
[31] Includes 347 for Iran, 354 for Iraq, 245 for Jordan, 8 650 for Lebanon, 3 276 for Turkey.
[32] In addition, the following fragmentary data are available for Malta: 1951/52 total 470, of which 232 from Australia, 135 from Canada; 1952/53 total 1 009, of which 606 from Australia, 144 from Canada.
[33] Data classified by country of birth.
[34] Data for North and South America, Unspecified, are aggregated.
[35] Data for Burma, Ceylon, India, Federation of Malaya and Singapore are aggregated.
[36] Immigrants born in Palestine who stayed abroad for an extended period.
[37] Data classified by country of citizenship or by ethnic group.
[38] Data for India and Pakistan are aggregated.
[39] Includes 4 680 for Federation of Malaya, 273 Eurasians.
[40] Includes 5 300 for Federation of Malaya, 290 Eurasians.
[41] Relates to South America also.

Notes du tableau 41

(a) [Sauf avis contraire, le total général des entrées d'immigrants ou de voyageurs, pour un quelconque des pays d'immigration, peut être facilement retrouvé dans le tableau 39 et ainsi rattaché à une catégorie principale d'entrées. Pour la définition et les autres particularités de cette catégorie principale, voir tableau 39.]

(b) [Les chiffres romains placés après les noms des pays se rapportent à l'origine des statistiques. (I) Statistiques des ports; (II) statistiques du contrôle aux frontières; (III) statistiques des fiches détachées de certains documents; (IV) statistiques des passeports; (V) statistiques des registres locaux de population; (VI) autres statistiques.]

* Provisoire.
[1] Classification par pays de citoyenneté.
[2] Y compris 295 pour le Liban et la Syrie en 1949 et 300 en 1950.
[3] Y compris 143 pour le Liban et la Syrie et 213 pour le Libéria.
[4] Y compris 220 pour le Liban et la Syrie et 259 pour le Libéria.
[5] Personnes de nationalité britannique.
[6] Y compris 48 pour le Kenya, 65 pour le Mozambique et 546 pour les Rhodésies du Nord et du Sud.
[7] Y compris 121 pour la Rhodésie du Nord et 324 pour la Rhodésie du Sud.
[8] Y compris 172 pour la Rhodésie du Nord et 340 pour la Rhodésie du Sud.
[9] Y compris 365 pour la Rhodésie du Nord et 694 pour la Rhodésie du Sud.
[10] Les données pour Ceylan et l'Inde sont groupées.
[11] Y compris 86 pour la Fédération de Malaisie en 1951, 141 en 1952 et 48 en 1953.
[12] Classification par pays de sortie.
[13] Y compris 846 pour les Antilles Néerlandaises, 3 445 pour les Indes Occidentales Britanniques et 6 007 pour les autres parties des Indes Occidentales.
[14] Y compris 794 pour les Antilles Néerlandaises, 4 409 pour les Indes Occidentales Britanniques et 7 397 pour les autres parties des Indes Occidentales.
[15] Y compris 670 pour la Colombie, 3 448 pour Cuba et 845 pour le Panama.
[16] Y compris 1 036 pour la Colombie, 3 943 pour Cuba et 954 pour le Panama.
[17] Les données pour l'Irlande (Rép.) et le Royaume-Uni sont groupées.
[18] La raison de la disparité entre ces données et celles qui leur correspondent dans le tableau 39 est que seuls les immigrants entrant pour la première fois sont compris ici; les différences représentent donc les nombres d'anciens résidents étrangers revenant après un séjour à l'étranger d'un an ou plus.
[19] La raison de la disparité entre ces données et celles qui leur correspondent dans le tableau 39 est une différence de définition. Les données du présent tableau se rapportent aux passagers étrangers de 2ème et 3ème classe ayant effectué par mer des trajets intercontinentaux.
[20] Y compris 321 pour le Chili, 45 pour le Paraguay, 83 pour l'Uruguay.
[21] Y compris 1 120 pour le Chili, 59 pour le Paraguay, 122 pour l'Uruguay.
[22] Y compris 1 438 pour le Chili, 79 pour le Paraguay, 93 pour l'Uruguay.
[23] Y compris 371 pour le Liban, 334 pour la Syrie, 253 pour la Turquie.
[24] Y compris 274 pour le Liban, 196 pour la Syrie, 176 pour la Turquie.
[25] Y compris 167 pour le Liban, 118 pour la Syrie, 85 pour la Turquie.
[26] On dispose aussi données fragmentaires pour les pays suivants: Fédération de Malaisie, 1953 total 205 865 dont 40 316 Malais, 31 888 Chinois, 39 197 Indiens et Pakistanais, 3 174 Européens et Américains; Turquie, 1951 total 102 436 dont 102 208 de Bulgarie, 228 d'autres parties de l'Europe; 1952 total 630; 1953 total 2 998 dont 1 113 de la Yougoslavie et 1 883 d'autres parties de l'Europe.
[27] Y compris 31 pour Hawaï.
[28] Y compris 26 pour la Birmanie, 26 pour le Cambodge, 636 pour Hong-Kong, 43 pour la Corée, 71 pour Macau, 84 pour la Fédération de Malaisie, 11 pour Bornéo du Nord, 117 pour la Thaïlande, 125 pour le Vietnam.
[29] Y compris 159 pour l'Iran, 229 pour l'Irak, 294 pour la Jordanie, 2 266 pour le Liban, 1 491 pour la Turquie.
[30] Y compris 53 pour l'Iran, 202 pour l'Irak, 334 pour la Jordanie, 7 976 pour le Liban, 3 124 pour la Turquie.
[31] Y compris 347 pour l'Iran, 354 pour l'Irak, 245 pour la Jordanie, 8 650 pour le Liban, 3 276 pour la Turquie.
[32] On dispose aussi de données fragmentaires pour Malte: 1951/52 total 470 dont 232 de l'Australie, 135 du Canada; 1952/53 total 1 009 dont 606 de l'Australie, 144 du Canada.
[33] Classification par pays de naissance.
[34] Les données pour les catégories Non spécifié relatives à l'Amérique du Nord et du Sud sont groupées.
[35] Les données pour la Birmanie, Ceylan, l'Inde, la Fédération de Malaisie et Singapour sont groupées.
[36] Immigrants nés en Palestine qui sont demeurés à l'étranger pendant une période prolongée.
[37] Classification par pays de citoyenneté ou par groupe ethnique.
[38] Les données pour l'Inde et le Pakistan sont groupées.
[39] Y compris 4 680 pour la Fédération de Malaisie, 273 Eurasiens.
[40] Y compris 5 300 pour la Fédération de Malaisie, 290 Eurasiens.
[41] Se rapporte aussi à l'Amérique du Sud.

Notes to Table 41 (continued)

[42] Included in North America, Unspecified.
[43] Data for Portugal and Spain are aggregated.
[44] Includes 707 for Greenland.
[45] Includes 694 for Faeroe Islands.
[46] Includes 118 for Luxembourg in 1951, 113 in 1952.
[47] Source V for 1952. Source II for 1953.
[48] Excluding arrivals from Berlin, Eastern Germany, the Eastern German territories under the administration of Poland or the USSR, the Saar, camps of the International Refugee Organization and repatriated prisoners of war.
[49] Includes data for North America, Unspecified.
[50] Data for Denmark and Iceland are aggregated.
[51] Data for Belgium and Luxembourg are aggregated.
[52] Data for Denmark, Finland, Iceland and Norway are aggregated.
[53] Data for Finland and Norway are aggregated.
[54] Supplementary data: from East Berlin 23 256, Eastern Germany 53 565, Eastern German territories under the administration of Poland or the USSR 1 123, Western Germany 15 855, Saar 67.
[55] Supplementary data: from East Berlin 22 128, Eastern Germany 54 994, Eastern German territories under the administration of Poland or the USSR 346, Western Germany 12 826, Saar 60.
[56] Supplementary data: from East Berlin 16 572, Eastern Germany 81 132, Eastern German territories under the administration of Poland or the USSR 197, Western Germany 12 906, Saar 34.
[57] Supplementary data: from East Berlin 40 682, Eastern Germany 276 921, Eastern German territories under the administration of Poland or the USSR 353, Western Germany 15 852, Saar 39.
[58] Reason for discrepancy between these and corresponding data in Table 39 is that continental immigrants are excluded here.
[59] Data for Europe and USSR are aggregated.
[60] Includes 2 101 for Cuba in 1950, 1 836 in 1951, 2 116 in 1952.
[61] Includes 293 for Uruguay in 1950, 459 in 1951, 727 in 1952.
[62] Includes 2 068 for Ceylon, 1 864 for Hong Kong, 6 590 for Federation of Malaya, 1 157 for Pakistan.
[63] Includes 1 806 for Ceylon, 2 760 for Hong Kong, 7 010 for Federation of Malaya, 1 554 for Pakistan.
[64] Includes 1 968 for Ceylon, 2 530 for Hong Kong, 7 042 for Federation of Malaya, 1 566 for Pakistan.
[65] Data for Ceylon, India and Pakistan are aggregated.
[66] Includes 344 for Ceylon, 1 636 for Cyprus, 850 for Hong Kong, 1 019 for Lebanon, 585 for Federation of Malaya.
[67] Includes 485 for Ceylon, 1 320 for Cyprus, 648 for Hong Kong, 200 for Lebanon, 610 for Federation of Malaya.
[68] Includes 311 for Ceylon, 165 for Cyprus, 459 for Hong Kong, 81 for Lebanon, 514 for Federation of Malaya.
[69] Includes 4 667 for Malta in 1951, 2 530 in 1952 and 1 419 in 1953.
[70] Includes 256 for Fiji Islands, 447 for New Guinea (Aust.), 304 for Papua.
[71] Includes 232 for Fiji Islands, 452 for New Guinea (Aust.), 352 for Papua.
[72] Includes 287 for Fiji Islands, 524 for New Guinea (Aust.), 276 for Papua.
[73] Years ended 31 March.
[74] Includes 381 for Fiji Islands in 1950/51 and 399 in 1951/52.
[75] Includes 407 for Cook Islands and Niue, 389 for Fiji Islands, 238 for Western Samoa.

Notes au tableau 41 (suite)

[42] Compris sous l'Amérique du Nord, Non spécifié.
[43] Les données pour le Portugal et l'Espagne sont groupées.
[44] Y compris 707 pour le Groenland.
[45] Y compris 694 pour les îles Féroé.
[46] Y compris 118 pour le Luxembourg en 1951 et 113 en 1952.
[47] Source V pour 1952. Source II pour 1953.
[48] Non compris les entrées en provenance de Berlin-Est, de l'Allemagne Orientale, des Territoires allemands de l'Est sous l'administration de la Pologne ou de l'URSS, de la Sarre et des camps de l'Organisation Internationale pour les Réfugiés, ni les prisonniers de guerre rapatriés.
[49] Y compris les données pour la catégorie Non spécifié relative à l'Amérique du Nord.
[50] Les données pour le Danemark et l'Islande sont groupées.
[51] Les données pour la Belgique et le Luxembourg sont groupées.
[52] Les données pour le Danemark, la Finlande, l'Islande et la Norvège sont groupées.
[53] Les données pour la Finlande et la Norvège sont groupées.
[54] Données supplémentaires: Berlin-Est 23 256, l'Allemagne Orientale 53 565, Territoires allemands de l'Est sous l'administration de la Pologne ou de l'URSS 1 123, l'Allemagne Occidentale 15 855, la Sarre 67.
[55] Données supplémentaires: Berlin-Est 22 128, l'Allemagne Orientale 54 994, Territoires allemands de l'Est sous l'administration de la Pologne ou de l'URSS 346, l'Allemagne Occidentale 12 826, la Sarre 60.
[56] Données supplémentaires: Berlin-Est 16 572, l'Allemagne Orientale 81 132, Territoires allemands de l'Est sous l'administration de la Pologne ou de l'URSS 197, l'Allemagne Occidentale 12 906, la Sarre 34.
[57] Données supplémentaires: Berlin-Est 40 682, l'Allemagne Orientale 276 921, Territoires allemands de l'Est sous l'administration de la Pologne ou l'URSS 353, l'Allemagne Occidentale 15 852, la Sarre 39.
[58] La raison de la disparité entre ces données et celles qui leur correspondent dans le tableau 39 est que les immigrants continentaux ne sont pas compris ici.
[59] Les données pour l'Europe et l'URSS sont groupées.
[60] Y compris 2 101 pour Cuba en 1950, 1 836 en 1951 et 2 116 en 1952.
[61] Y compris 293 pour l'Uruguay en 1950, 459 en 1951 et 727 en 1952.
[62] Y compris 2 068 pour Ceylan, 1 864 pour Hong-Kong, 6 590 pour la Fédération de Malaisie et 1 157 pour le Pakistan.
[63] Y compris 1 806 pour Ceylan, 2 760 pour Hong-Kong, 7 010 pour la Fédération de Malaisie et 1 554 pour le Pakistan.
[64] Y compris 1 968 pour Ceylan, 2 530 pour Hong-Kong, 7 042 pour la Fédération de Malaisie et 1 566 pour le Pakistan.
[65] Les données pour Ceylan et le Pakistan sont groupées.
[66] Y compris 344 pour Ceylan, 1 636 pour Chypre, 850 pour Hong-Kong, 1 019 pour le Liban et 585 pour la Fédération de Malaisie.
[67] Y compris 485 pour Ceylan, 1 320 pour Chypre, 648 pour Hong-Kong, 200 pour le Liban et 610 pour la Fédération de Malaisie.
[68] Y compris 311 pour Ceylan, 165 pour Chypre, 459 pour Hong-Kong, 81 pour le Liban et 514 pour la Fédération de Malaisie.
[69] Y compris 4 667 pour Malte en 1951, 2 530 en 1952 et 1 419 en 1953.
[70] Y compris 256 pour les îles Fidji, 447 pour la Nouvelle-Guinée (Aust.) et 304 pour Papua.
[71] Y compris 232 pour les îles Fidji, 452 pour la Nouvelle-Guinée (Aust.) et 352 pour Papua.
[72] Y compris 287 pour les îles Fidji, 524 pour la Nouvelle-Guinée (Aust.) et 276 pour Papua.
[73] Années finissant le 31 mars.
[74] Y compris 381 pour les îles Fidji en 1950/51 et 399 en 1951/52.
[75] Y compris 407 pour les îles Cook et Niue, 389 pour les îles Fidji et 238 pour le Samoa Occidental.

42. Emigrants by age and sex : 1950–1953

Emigrants selon l'âge et le sexe : 1950–1953

[Uness otherwise indicated, the total for both sexes for any country may be readily identified in Table 39 and thus related to a major category of arrivals. For definition and other particulars of the major category, see Table 39. Roman numerals following country names are explained on page 653, note (b). For discussion, see page 45.

Sauf avis contraire, le total relatif aux deux sexes pour un pays quelconque peut être facilement retrouvé dans le tableau 39 et ainsi rattaché à une catégorie principale d'entrée. Pour la définition et les autres particularités de cette catégorie principale, voir tableau 39. Les chiffres romains placés après les noms des pays sont expliqués à la page 653, note (b). Voir explications à la page 91.]

[2] Reason for discrepancy between these and corresponding data in Table 39 is a difference in definition. Data given here relate to alien 2nd and 3rd class passengers travelling by sea over intercontinental routes.
[3] See end of table for 1947 and 1948 data not previously published in the *Yearbook*.
[4] Includes 330 persons of unknown sex.
[5] Includes 430 persons of unknown sex.

[2] La raison de la disparité entre ces données et celles qui leur correspondent dans le tableau 39 est une différence de définition. Les données du présent tableau se rapportent aux passagers étrangers de 2ème et 3ème classe effectuant par mer des trajets intercontinentaux.
[3] Voir ci-après les données relatives aux années 1947 et 1948 non encore publiées dans l'annuaire démographique.
[4] Y compris 330 personnes de sexe inconnu.
[5] Y compris 430 personnes de sexe inconnu.

* Provisional.
[6] Age groups derived from year of birth.
[8] Reason for discrepancy between these and corresponding data in Table 39 is that continental emigrants are excluded here.

* Provisoire.
[6] Groupes d'âge calculés d'après l'année de naissance.
[8] La raison de la disparité entre ces données et celles qui leur correspondent dans le tableau 39 est que les émigrants continentaux ne sont pas compris ici.

[9] Years ending 31 March of the following year.
[10] Reason for discrepancy of 2 058 between this and corresponding figure in Table 39 not ascertained.
[11] Reason for discrepancy between these and corresponding data in Table 39 is that only first-time emigrants are included here.

[9] Années finissant le 31 mars de l'année suivante.
[10] La raison de la différence de 2 058 entre ce chiffre et celui qui lui correspond dans le tableau 39 n'a pu être déterminée.
[11] La raison de la disparité entre ces données et celles qui leur correspondent dans le tableau 39 est que seuls les émigrants sortant pour la première fois sont compris ici.

42. Emigrants by age and sex (continued)

Emigrants selon l'âge et le sexe (suite)

* Provisional.

[12] Reason for discrepancy between these and corresponding data in Table 39 is the difference in definition. Data given here relate to national and alien intercontinental emigrants reported by the Swiss emigration agencies.

* Provisoire.

[12] La raison de la disparité entre ces données et celles qui leur correspondent dans le tableau 39 est une différence de définition. Les données du présent tableau se rapportent aux émigrants intercontinentaux, nationaux et étrangers, d'après les renseignements fournis par les agences suisses d'émigration.

42. Emigrants by age and sex (continued)

43. Immigrants by age and sex : 1950–1953

Immigrants selon l'âge et le sexe : 1950–1953

[Unless otherwise indicated, the total for both sexes for any country may be readily identified in Table 39 and thus related to a major category of arrivals. For definition and other particulars of the major category, see Table 39. Roman numerals following country names are explained on page 664, note (b). For discussion, see page 45.—Sauf avis contraire, le total relatif aux deux sexes pour un pays quelconque peut être facilement retrouvé dans le tableau 39 et ainsi rattaché à une catégorie principale d'entrée. Pour la définition et les autres particularités de cette catégorie principale, voir tableau 39. Les chiffres romains placés après les noms des pays sont expliqués à la page 664, note (b). Voir explications à la page 91.]

[2] Reason for discrepancy between these and corresponding data in Table 39 is that only first-time immigrants are included here; differences therefore represent the number of former alien residents returning after a sojourn abroad of one year or more.

[3] Reason for discrepancy between these and corresponding data in Table 39 is the difference in definition. Data given here relate to alien 2nd and 3rd class passengers having travelled by sea over intercontinental routes.

[4] See end of table for 1947 and 1948 data not previously published in the *Yearbook*.

[5] Reason for discrepancy between this and corresponding figure in Table 39 is that only first-time immigrants are included here.

[2] La raison de la disparité entre ces données et celles qui leur correspondent dans le tableau 39 est que seuls les immigrants entrant pour la première fois sont compris ici; les différences représentent donc les nombres d'anciens résidents étrangers revenant après un séjour à l'étranger d'un an ou plus.

[3] La raison de la disparité entre ces données et celles qui leur correspondent dans le tableau 39 est une différence de définition. Les données du présent tableau se rapportent aux passagers étrangers de 2ème et 3ème classe ayant effectué par mer des trajets intercontinentaux.

[4] Voir ci-après les données relatives aux années 1947 et 1948 non encore publiées dans l'annuaire démographique.

[5] La raison de la disparité entre ce chiffre et celui qui lui correspond dans le tableau 39 est que seuls les immigrants entrant pour la première fois sont compris ici.

* Provisional.

[13] Reason for discrepancy between these and corresponding data in Table 39 is that continental immigrants are excluded here.

* Provisoire.

[13] La raison de la disparité entre ces données et celles qui leur correspondent dans le tableau 39 est que les immigrants continentaux ne sont pas compris ici.

43. Immigrants by age and sex (continued)

Immigrants selon l'âge et le sexe (suite)

BIBLIOGRAPHY

BIBLIOGRAPHIE

BIBLIOGRAPHY

This bibliography presents citations to recent official publications containing census and other demographic statistics for each area of the world. It is a continuation of the bibliography which appeared in the *Demographic Yearbook 1953*. Only new titles which did not appear in last year's bibliography are included here, except for certain serial publications which during the intervening period have undergone a significant change as regards nature of content, title, issuing agency and so forth, which have resumed publication after an interruption or which have just come to the attention of the compiler. Therefore certain countries for which new data are available are not included in this bibliography, or are represented by only one or two new titles because their major new statistical output has been published in regular periodical publications which were already listed in the previous bibliography. In the case of censuses of population, only new volumes are included; e.g., volumes 1 and 2 of the 1948 census of Algeria were included in last year's bibliography, therefore only volume 3, which has appeared since, is included in this one. This means that the present bibliography must be used in conjunction with the previous one if a more complete listing of recent demographic publications is desired.

This bibliography was prepared for the United Nations by the Census Library Project of the United States Library of Congress.

BIBLIOGRAPHIE

La présente bibliographie donne la liste des publications officielles récentes relatives aux recensements et autres statistiques démographiques de chaque pays et territoire du monde. Elle constitue une suite de celle qui se trouvait dans l'*Annuaire démographique 1953*. Seuls, les titres nouveaux qui n'ont pas été mentionnés dans la bibliographie de la dernière édition de l'*Annuaire* le sont ici, à l'exception toutefois de certaines publications périodiques ayant subi entre temps des modifications importantes en ce qui concerne leur titre, la nature des informations fournies, leur source etc., qui ont repris leur publication après l'avoir interrompue et de celles qui viennent seulement d'être signalées à l'attention du compilateur. Par suite, certains pays pour lesquels de nouvelles données sont disponibles ne figurent pas dans cette bibliographie ou y sont représentés par un ou deux titres à peine, leur principale production statistique récente ayant été publiée dans des périodiques déjà cités dans la bibliographie précédente. Dans le cas des recensements de population, il n'est fait mention que des volumes nouvellement parus; ainsi, comme les volumes 1 et 2 du recensement de 1948 en Algérie ont été énumérés dans la bibliographie de l'année dernière, seul le volume 3 qui a paru depuis est indiqué dans celle-ci En conséquence, la présente bibliographie et la précédente doivent être utilisées de concert si l'on désire avoir une vue d'ensemble des dernières publications démographiques.

Cette bibliographie a été établie pour l'Organisation des Nations Unies par le "Census Library Project" de la bibliothèque du Congrès des Etats-Unis.

INTERNATIONAL COMPILATIONS — RECUEILS DE STATISTIQUES INTERNATIONALES

United Nations. *Population Division.*

The population of Central America (including Mexico), 1950–1980. New York, 1954. 84 p. (Future population estimates by age and sex, report 1; ST/SOA/Series A, Population studies, no. 16)

CUMULATIVE LIST OF YEARBOOK TABLES

LISTE DES TABLEAUX PARUS DANS L'ANNUAIRE

Cumulative list of Yearbook tables

[Subjects and time periods covered by tables presented in each issue of the Demographic Yearbook.]

Subject	Time period		
	1948 Issue Edition de 1948	1949/50 Issue Edition de 1949/50	1951 Issue Edition de 1951
POPULATION			
AREA AND TOTAL POPULATION			
Population, area and density for each part of the world	Latest census and midyear estimates 1937, 1946 and 1947 — Dernier recensement et estimations au milieu de l'année, 1937, 1946 et 1947	Latest census and midyear estimates for 1937, 1947, 1948 and 1949 — Dernier recensement et estimations au milieu de l'année, 1937, 1947, 1948 et 1949	Latest census and midyear estimates for 1937, 1948, 1949 and 1950 — Dernier recensement et estimations au milieu de l'année, 1937, 1948, 1949 et 1950
Population, area and density of the world, by continent	—	—	Midyear 1950 — Au milieu de l'année 1950
Population, area and density of continental divisions, by regions	—	—	—
Area, enumerated population and intercensal rates of increase	1900 – 1948	1900 – 1950	1900 – 1951
Estimates of total population	1932 – 1947	1932 – 1949	1932 – 1950
AGE AND SEX COMPOSITION			
Population by age and sex	Number and percentage distribution: latest census, latest estimate, mid-year 1945 — Nombres et pourcentage de répartition: dernier recensement, et dernière estimation au milieu de l'année 1945	Number and percentage distribution: recent censuses, mid-year 1945 and latest estimate — Nombres et pourcentage de répartition: recensements récents et estimations au milieu de l'année (1945 et au-delà)	Number and percentage distribution: latest census and latest estimate (new data only) — Nombres et pourcentage de répartition: dernier recensement et dernière estimation (donnée inédites seulement)
MARITAL STATUS			
Population by age, sex and marital status	Latest census — Dernier recensement	Recent censuses — Recensement récents	—
Percentage distribution of population by marital status for each age-sex group	Latest census — Dernier recensement	—	—
Percentage single by age and sex	—	Recent censuses — Recensement récents	—
Married population by age and sex, number and per cent in each age group	—	—	—
ILLITERATE POPULATION			
Illiterate population, by age and sex	Latest census — Dernier recensement	—	—
GEOGRAPHIC DISTRIBUTION			
Population by major civil divisions	—	—	—
Urban and rural population	Latest census — Dernier recensement	—	—
Population of localities classified by number of inhabitants	Latest census — Dernier recensement	—	—
Population of capitals and of cities of 100 000 or more inhabitants	—	—	—
ECONOMICALLY ACTIVE POPULATION			
Economically active population by sex	Latest census — Dernier recensement	Recent censuses — Recensements récents	—
Percentage of economically active population in each age-sex group	Latest census — Dernier recensement	Recent censuses — Recensements récents	—

PUBLICATIONS OF THE WORLD HEALTH ORGANIZATION

Annual Epidemiological And Vital Statistics 1952*

This Annual is the fifth of the series appearing under the auspices of the World Health Organization. It comprises in a single volume the two reports which in years past were published separately, i.e., Part I devoted to vital statistics and causes of death and Part II dealing with cases of and deaths from notifiable diseases. It contains the general demographic information essential for the understanding of the data on specific mortality and on morbidity (population, births, and general, infant, and neonatal mortality). The causes of death are presented for the year 1952 in detail according to the Abridged List, by sex and age and covering about 30 countries. Special tables give details of infant mortality from certain causes according to sex and age, of tuberculosis mortality, and mortality from malignant neoplasms according to site by sex and age. Mortality rates by sex are shown in respect of certain diseases and by age in respect of others. The second part gives statistics of notifications of cases and deaths from 36 communicable diseases with details of seasonal distribution, that is, by month or by period of 4 weeks. A list of the diseases which are compulsorily notifiable in the various countries completes the volume.

Prepared by the Division of Epidemiological and Health Statistical Services

World Health Organization

Geneva

* Publication expected in May 1955

PUBLICATIONS DE L'ORGANISATION MONDIALE DE LA SANTE

Statistiques Epidémiologiques et Démographiques Annuelles 1952*

Cet annuaire est le cinquième de la série, paru sous les auspices de l'Organisation Mondiale de la Santé; il réunit en un seul volume les deux rapports publiés séparément dans le passé, soit: la Partie I consacrée au mouvement de la population et aux causes de décès et la Partie II, consacrée aux cas et décès de maladies à déclaration obligatoire. Il contient les informations essentielles de démographie générale nécessaires à la compréhension des données sur la mortalité spécifique et la morbidité (population, naissances, mortalité générale, infantile et néonatale). Les causes de décès sont présentées, pour l'année 1952, dans leur détail selon les Nomenclatures abrégées, par sexe et groupes d'âge, pour trente pays environ.. Des tableaux spéciaux apportent des détails sur la mortalité infantile, par certaines causes, d'après le sexe et l'âge, sur la mortalité due à la tuberculose et aux tumeurs malignes d'après la localisation, et également selon le sexe et l'âge. On y trouve également des taux de mortalité par sexe pour certaines maladies, et par âge également pour d'autres maladies. La seconde partie reproduit les statistiques des cas déclarés et des décès pour 36 maladies infectieuses, détaillés d'après leur distribution saisonnière, c'est-à-dire par mois ou par période de 4 semaines. Un liste des maladies à déclaration obligatoire dans les divers pays termine cet important rapport.

Préparé par la Division des Services d'Epidémiologie et de Statistiques Sanitaires

Organisation Mondiale de la Sante

Genève

* A paraître en mai 1955.

UNITED NATIONS NATIONS UNIES

STATISTICAL YEARBOOK 1954

Sixth issue of a comprehensive collection of international statistics presented in 179 tables, most of which cover a twenty-year period ending 1953 or mid-1954. The *Yearbook* contains, *inter alia*, statistics relating to: structure of mining and of manufacturing; textile and transport equipment; production of over 100 commodities; consumption of food, energy and raw materials; railways, shipping, civil aviation and tourist travel; postal and telegraph services, telephones; external trade of virtually all trading countries; national budget accounts, showing expenditure for defence, social services, etc.; social security; housing; medical personnel; educational institutions; newsprint and newspapers, books, films and broadcasting.

Chapter headings: population; manpower; agriculture; forestry; fishing; industrial production; mining, quarrying; manufacturing; construction; electricity, gas; consumption; transport; communications; internal trade; external trade; balance of payments; wages and prices; national income; finance; public finance; social statistics; education, culture. Also appendices showing conversion factors and the principal statistics published by international organizations, and alphabetical subject and country indexes.
